

Common Criteria for Information Technology Security Evaluation

International hacking scandals are putting the spotlight on countries' security loopholes and weakness. With many governments calling for higher security, their requirements for vendors are getting more stringent.

The Common Criteria facilitates mutual recognition of evaluation and certification results of Information Technology products. Now recognized as the ISO/IEC 15408, it defines a common set of security functions to establish that IT products adhere to international regulatory requirements - thus reducing the number of security evaluations required to enter new markets, while achieving high product security assurance.

UL is committed to helping you get your products to market in the most efficient way possible, regardless of the complexity of your design and choice of technology.

As a Common Criteria IT Security Evaluation Facility, UL provides consulting and evaluation services to help IT vendors successfully complete security evaluations. With our extensive experience, we have created an evaluation process that can be tailored to fit unique customer needs.
