

## PrimeGrid's The Riesel Problem

On 26 May 2011 11:08:52 UTC, PrimeGrid's The Riesel Problem project eliminated  $k=141941$  by finding the Mega Prime:

$$141941 * 2^{4299438} - 1$$

The prime is 1,294,265 digits long and will enter Chris Caldwell's "The Largest Known Primes Database" (<http://primes.utm.edu/primes>) ranked 25th overall. This is the largest prime found in The Riesel Problem and PrimeGrid's sixth elimination. 58  $k$ 's now remain.

The discovery was made by Scott Brown of the United States using an Intel Core2 Duo E8400 @ 3.0GHz with 4 GB RAM running Windows 7. This computer took just over 7 hours and 25 minutes to complete the primality test using LLR. Scott is a member of the Duke University team.

The prime was verified on 28 May 2011 23:08:20 UTC, by Piotr M. Zalewski of Poland using an Intel Pentium Dual-Core E6300 @ 2.80GHz with 4 GB RAM running Windows Server 2003 Enterprise Server x64. This computer took just over 8 hours and 57 minutes to complete the primality test using LLR. Piotr is a member of the BOINC@Poland Team.

Credits for the discovery are as follows:

1. Scott Brown, discoverer
2. PrimeGrid, et al.
3. Srsieve, sieving program developed by Geoff Reynolds
4. LLR, primality program developed by Jean Penné

Entry in "The Largest Know Primes Database" can be found here:

Hans Ivar Riesel, a Swedish mathematician, showed in 1956 that there are an infinite number of positive odd integer  $k$ 's such that  $k * 2^n - 1$  is composite (not prime) for every integer  $n \geq 1$ . These numbers are now called Riesel numbers. He further showed that  $k=509203$  was such one.

It is conjectured that 509203 is the smallest Riesel number. The Riesel Problem consists in determining that 509203 is the smallest Riesel number. To show that it is the smallest, a prime of the form  $k * 2^n - 1$  must be found for each of the positive integer  $k$ 's less than 509203. For more information about The Riesel Problem, please visit Wilfrid Keller's **The Riesel Problem: Definition and Status** (<http://www.prothsearch.net/rieselprob.html>).

Using a single PC would have taken years to find this prime. So this timely discovery would not have been possible without the hundreds of volunteers who contributed their spare CPU cycles. A special thanks to everyone who offered their advice and/or computing power to the search - especially Sean Faith and Brian Carpenter who provided support information from the previous Riesel Sieve effort.

The Riesel Problem project will continue to seek primes for the 58 remaining  $k$ 's. To

## About PrimeGrid

PrimeGrid is a distributed computing project, developed by Rytis Slatkevičius, which utilizes BOINC and PRPNet to search for primes. PrimeGrid's primary goal is to bring the excitement of prime finding to the "everyday" computer user. Simply download the software and let your computer do the rest. Participants can choose from a variety of prime forms to search. With a little patience, you may find a large or even record breaking prime.

### BOINC

The Berkeley Open Infrastructure for Network Computing (BOINC) is a software platform for distributed computing using volunteered computer resources. It allows users to participate in multiple distributed computing projects through a single program. Currently BOINC is being developed by a team based at the University of California, Berkeley led by David Anderson.

This platform currently supports projects from biology to math to astronomy. For more information, please visit BOINC: <http://boinc.berkeley.edu>

### PRPNet

PRPNet is a client/server application written by Mark Rodenkirch that is specifically designed to help find prime numbers of various forms. It is easily ported between various OS/hardware combinations. PRPNet does not run each PRP test itself, but relies on helper programs, such as LLR, PFGW, phrot, and genefer to do the work.

For more information, please visit PrimeGrid's PRPNet forum thread: [http://www.primegrid.com/forum\\_thread.php?id=1215](http://www.primegrid.com/forum_thread.php?id=1215)
