# EXCEPTIONAL SETS IN WARING'S PROBLEM: TWO SQUARES AND s BIQUADRATES

LILU ZHAO

ABSTRACT. Let  $R_s(n)$  denote the number of representations of the positive number n as the sum of two squares and s biquadrates. When  $s = 3$ or 4, it is established that the anticipated asymptotic formula for  $R_s(n)$ holds for all  $n \leq X$  with at most  $O(X^{(9-2s)/8+\varepsilon})$  exceptions.

### 1. INTRODUCTION

Waring's problem for sums of mixed powers involving one or two squares has been widely investigated. In 1987-1988, Brüdern  $[1, 2]$  $[1, 2]$  considered the representation of  $n$  in the form

$$
n = x_1^2 + x_2^2 + y_1^{k_1} + \dots + y_s^{k_s},
$$

with  $k_1^{-1} + \cdots + k_s^{-1} > 1$ . Linnik [\[8\]](#page-10-2) and Hooley [\[6\]](#page-10-3) investigated sums of two squares and three cubes. In 2002, Wooley [\[11\]](#page-10-4) investigated the exceptional set related to the asymptotic formula in Waring's problem involving one square and five cubes. Recently, Brüdern and Kawada [\[3\]](#page-10-5) established the asymptotic formula for the number of representations of the positive number n as the sum of one square and seventeen fifth powers.

Let  $R_s(n)$  denote the number of representations of the positive number  $n$  as the sum of two squares and  $s$  biquadrates. Very recently, subject to the truth of the Generalised Riemann Hypothesis and the Elliott-Halberstam Conjecture, Friedlander and Wooley [\[4\]](#page-10-6) established that  $R_3(n) > 0$  for all large  $n$  under certain congruence conditions. They also showed that if one is prepared to permit a small exceptional set of natural numbers  $n$ , then the anticipated asymptotic formula for  $R_s(n)$  can be obtained. To state their results precisely, we introduce some notations. We define

(1.1) 
$$
\mathfrak{S}_s(n) = \sum_{q=1}^{\infty} \sum_{\substack{a=1 \ (a,q)=1}}^q q^{-2-s} S_2(q,a)^2 S_4(q,a)^s e(-na/q),
$$

<sup>2010</sup> Mathematics Subject Classification. Primary 11P05; Secondary 11P55, 11N37.

Key words and phrases. circle method, Waring's problem, exceptional sets, asymptotic formula.

where the Gauss sum  $S_k(q, a)$  is defined as

(1.2) 
$$
S_k(q, a) = \sum_{r=1}^q e(ar^k/q).
$$

As in [\[4\]](#page-10-6), we refer a function  $\psi(t)$  as being a *sedately increasing function* when  $\psi(t)$  is a function of a positive variable t, increasing monotonically to infinity, and satisfying the condition that when t is large, one has  $\psi(t)$  =  $O(t^{\delta})$  for a positive number  $\delta$  sufficiently small in the ambient context. Then we introduce  $E_s(X, \psi)$  to denote the number of integers n with  $1 \leq n \leq X$ such that

(1.3) 
$$
\left| R_s(n) - c_s \Gamma(\frac{5}{4})^4 \mathfrak{S}_s(n) n^{s/4} \right| > n^{s/4} \psi(n)^{-1},
$$

where  $c_3 = \frac{2}{3}$ 3  $\sqrt{2}$  and  $c_4 = \frac{1}{4}$  $\frac{1}{4}\pi$ . Friedlander and Wooley [\[4\]](#page-10-6) established the upper bounds

(1.4) 
$$
E_3(X,\psi) \ll X^{1/2+\varepsilon}\psi(X)^2
$$

and

(1.5) 
$$
E_4(X,\psi) \ll X^{1/4+\varepsilon} \psi(X)^4,
$$

where  $\varepsilon > 0$  is arbitrary small.

The main purpose of this note is to establish the following result.

<span id="page-1-0"></span>**Theorem 1.1.** *Suppose that*  $\psi(t)$  *is a sedately increasing function. Let*  $E_s(X, \psi)$  *be defined as above. Then for each*  $\varepsilon > 0$ *, one has* 

$$
(1.6) \t\t E_3(X,\psi) \ll X^{3/8+\varepsilon}\psi(X)^2
$$

*and*

$$
(1.7) \t E_4(X,\psi) \ll X^{1/8+\varepsilon}\psi(X)^2,
$$

*where the implicit constants may depend on*  $\varepsilon$ *.* 

We establish Theorem [1.1](#page-1-0) by means of the Hardy-Littlewood method. In order to estimate the corresponding exceptional sets effectively, we employ the method developed by Wooley [\[10,](#page-10-7) [11\]](#page-10-4).

As usual, we write  $e(z)$  for  $e^{2\pi i z}$ . Whenever  $\varepsilon$  appears in a statement, either implicitly or explicitly, we assert that the statement holds for each  $\varepsilon > 0$ . Note that the "value" of  $\varepsilon$  may consequently change from statement to statement. We assume that X is a large positive number, and  $\psi(t)$  is a sedately increasing function.

#### 2. Preparations

Throughout this section, we assume that  $X/2 < n \leq X$ . For  $k \in \{2, 4\}$ , we define the exponential sum

$$
f_k(\alpha) = \sum_{1 \leq x \leq P_k} e(\alpha x^k),
$$

where  $P_k = X^{1/k}$ . We take s to be either 3 or 4. By orthogonality, we have

<span id="page-2-3"></span>(2.1) 
$$
R_s(n) = \int_0^1 f_2(\alpha)^2 f_4(\alpha)^s e(-n\alpha) d\alpha.
$$

When Q is a positive number, we define  $\mathfrak{M}(Q)$  to be the union of the intervals

$$
\mathfrak{M}_Q(q, a) = \{ \alpha : \ |q\alpha - a| \leqslant QX^{-1} \},
$$

with  $1 \leq a \leq q \leq Q$  and  $(a, q) = 1$ . Whenever  $Q \leq X^{1/2}/2$ , the intervals  $\mathfrak{M}_Q(q,a)$  are pairwise disjoint for  $1 \leq a \leq q \leq Q$  and  $(a,q) = 1$ . Let  $\nu$  be a sufficiently small positive number, and let  $R = P_4^{\nu}$ . We take  $\mathfrak{M} = \mathfrak{M}(R)$ and  $\mathfrak{m} = (R/N, 1 + R/N] \setminus \mathfrak{M}$ . Write

$$
v_k(\beta) = \int_0^{P_k} e(\gamma^k \beta) d\gamma.
$$

One has the estimate

$$
v_k(\beta) \ll P_k(1+X|\beta|)^{-1/k}.
$$

For  $\alpha \in \mathfrak{M}_{X^{1/2}/2}(q, a) \subseteq \mathfrak{M}(X^{1/2}/2)$ , we define

<span id="page-2-0"></span>(2.2) 
$$
f_k^*(\alpha) = q^{-1} S_k(q, a) v_k(\alpha - a/q).
$$

It follows from Theorem 4.1 [\[9\]](#page-10-8) that whenever  $\alpha \in \mathfrak{M}_{X^{1/2}/2}(q, a)$ , one has

<span id="page-2-1"></span>(2.3) 
$$
f_k(\alpha) - f_k^*(\alpha) \ll q^{1/2} (1 + X|\alpha - a/q|)^{1/2} X^{\varepsilon}.
$$

We define the multiplicative function  $w_k(q)$  by taking

$$
w_k(p^{uk+v}) = \begin{cases} kp^{-u-1/2}, & \text{when } u \geqslant 0 \text{ and } v = 1, \\ p^{-u-1}, & \text{when } u \geqslant 0 \text{ and } 2 \leqslant v \leqslant k. \end{cases}
$$

Note that  $q^{-1/2} \leq w_k(q) \leq q^{-1/k}$ . Whenever  $(a, q) = 1$ , we have

$$
q^{-1}S_k(q, a) \ll w_k(q).
$$

Therefore for  $\alpha = a/q + \beta \in \mathfrak{M}_{X^{1/2}/2}(q, a) \subseteq \mathfrak{M}(X^{1/2}/2)$ , one has

<span id="page-2-2"></span>
$$
(2.4) \t fk*(\alpha) \ll wk(q)Pk(1+X|\beta|)^{-1/k} \ll Pkq^{-1/k}(1+X|\beta|)^{-1/k}.
$$

The following conclusion is (4.1) in [\[4\]](#page-10-6).

<span id="page-3-2"></span>Lemma 2.1. *One has*

$$
\int_{\mathfrak{M}} f_2(\alpha)^2 f_4(\alpha)^s e(-n\alpha) d\alpha = c_s \Gamma(\frac{5}{4})^4 \mathfrak{S}_s(n) n^{s/4} + O(n^{s/4 - \kappa + \varepsilon}),
$$

*for a suitably small positive number* κ*.*

The next result provides the value of the Gauss sum  $S_2(q, a)$ .

<span id="page-3-1"></span>**Lemma 2.2.** *The Gauss sum*  $S_2(q, a)$  *satisfies the following properties. (i)* If  $(2a, q) = 1$ *, then* 

$$
S_2(q, a) = \left(\frac{a}{q}\right) S_2(q, 1).
$$

*Here by*  $\left(\frac{a}{a}\right)$  $\left(\frac{a}{q}\right)$  we denote the Jacobi symbol. *(ii) If* q *is odd, then*

$$
S_2(q, 1) = \begin{cases} q^{1/2}, & \text{if } q \equiv 1 \pmod{4}, \\ iq^{1/2}, & \text{if } q \equiv 3 \pmod{4}. \end{cases}
$$

*(iii) If* (2, a) = 1*, then*

$$
S_2(2^m, a) = \begin{cases} 0, & \text{if } m = 1, \\ 2^{m/2}(1 + i^a), & \text{if } m \text{ is even,} \\ 2^{(m+1)/2}e(a/8), & \text{if } m > 1 \text{ and } m \text{ is odd.} \end{cases}
$$

*(iv)* If  $(q_1, q_2) = 1$ *, then* 

$$
S_2(q_1q_2, a_1q_2 + a_2q_1) = S_2(q_1, a_1)S_2(q_2, a_2).
$$

*Proof.* These properties can be found in Lemma 2 [\[5\]](#page-10-9).

### 3. The Proof of Theorem [1.1](#page-1-0)

Let  $\tau$  be a fixed sufficiently small positive number. Set  $Y = P_4^{3/2+\tau} \psi(X)^2$ . We define  $\mathfrak{m}_1 = \mathfrak{m} \setminus \mathfrak{M}(X^{1/2}/2), \mathfrak{m}_2 = \mathfrak{M}(X^{1/2}/2) \setminus \mathfrak{M}(Y), \mathfrak{m}_3 = \mathfrak{M}(Y) \setminus \mathfrak{M}(Y)$  $\mathfrak{M}(P_4)$  and  $\mathfrak{m}_4 = \mathfrak{M}(P_4) \setminus \mathfrak{M}$ . Let  $\eta(n)$  be sequence of complex numbers satisfying  $|\eta(n)| = 1$ . Let Z be a subset of  $\{n \in \mathbb{N} : X/2 < n \leq X\}$ . We abbreviate card( $Z$ ) to Z. Then we introduce the exponential sum  $\mathcal{E}(\alpha)$  by

$$
\mathcal{E}(\alpha) = \sum_{n \in \mathcal{Z}} \eta(n) e(-n\alpha).
$$

For  $1 \leq j \leq 4$ , we define

<span id="page-3-0"></span>(3.1) 
$$
\mathcal{I}_j = \int_{\mathfrak{m}_j} |f_2(\alpha)|^2 f_4(\alpha)^s \mathcal{E}(\alpha)| d\alpha.
$$

<span id="page-3-3"></span>**Lemma 3.1.** Let  $\mathcal{I}_1$  be defined in  $(3.1)$ *. Then we have* 

$$
\mathcal{I}_1 \ll P_4^{4-\frac{1}{4}+\frac{s-3}{2}+\varepsilon} Z^{1/2} + P_4^{s-\frac{1}{4}+\varepsilon} Z.
$$

*Proof.* For any  $\alpha \in \mathfrak{m}_1$ , there exist a and q with  $1 \leq a \leq q \leq 2X^{1/2}$  and  $(a, q) = 1$  such that  $|q\alpha - a| \leq X^{-1/2}/2$ . Since  $\alpha \in \mathfrak{m}_1$ , we conclude that  $q > X^{1/2}/2$ . It follows from Weyl's inequality (Lemma 2.4 [\[9\]](#page-10-8)) that

$$
f_2(\alpha) \ll P_2^{1/2+\epsilon}
$$
 for  $\alpha \in \mathfrak{m}_1$ .

Thus we have

$$
\mathcal{I}_1 \ll P_2^{1+\varepsilon} \int_{\mathfrak{m}_1} |f_4(\alpha)^s \mathcal{E}(\alpha)| d\alpha
$$
  

$$
\ll P_2^{1+\varepsilon} \Big( \int_0^1 |f_4(\alpha)^6| d\alpha \Big)^{\frac{1}{2}} \Big( \int_0^1 |f_4(\alpha)^{2(s-3)} \mathcal{E}(\alpha)^2| d\alpha \Big)^{\frac{1}{2}}.
$$

By Hua's inequality (Lemma 2.5 [\[9\]](#page-10-8)) and Schwartz's inequality,

$$
\int_0^1 |f_4(\alpha)^6| d\alpha \ll \Big(\int_0^1 |f_4(\alpha)^4| d\alpha\Big)^{1/2} \Big(\int_0^1 |f_4(\alpha)^8| d\alpha\Big)^{1/2} \ll P_4^{7/2+\varepsilon}.
$$

When  $s = 4$ , one has the bound  $\int_0^1 |f_4(\alpha)^{2(s-3)} \mathcal{E}(\alpha)|^2 d\alpha \ll P_4 Z + P_4^{\varepsilon} Z^2$ . Then we can conclude that

<span id="page-4-0"></span>(3.2) 
$$
\mathcal{I}_1 \ll P_4^{4-\frac{1}{4}+\frac{s-3}{2}+\varepsilon} Z^{1/2} + P_4^{s-\frac{1}{4}+\varepsilon} Z.
$$

Indeed when  $s = 3$ , the estimate [\(3.2\)](#page-4-0) holds with  $P_4^{s-\frac{1}{4}+\varepsilon}Z$  omitted.  $\Box$ 

**Lemma 3.2.** Let  $\mathcal{I}_2$  be given by  $(3.1)$ *. Then one has* 

$$
\mathcal{J}_2 \ll P_4^{4-\frac{1}{4}+\frac{s-3}{2}+\varepsilon} Z^{1/2} + P_4^{s-\tau/2+\varepsilon} \psi(X)^{-1} Z.
$$

*Proof.* We introduce

$$
\mathcal{J}_1 = \int_{\mathfrak{m}_2} \left| \left( f_2(\alpha) - f_2^*(\alpha) \right)^2 f_4(\alpha)^s \mathcal{E}(\alpha) \right| d\alpha
$$

and

$$
\mathcal{J}_2 = \int_{\mathfrak{m}_2} |f_2^*(\alpha)^2 f_4(\alpha)^s \mathcal{E}(\alpha)| d\alpha.
$$

Note that  $|f_2(\alpha)|^2 \ll |f_2(\alpha) - f_2^*(\alpha)|^2 + |f_2^*(\alpha)|^2$ , where  $f_2^*(\alpha)$  is defined in [\(2.2\)](#page-2-0). Then one has

<span id="page-4-1"></span>(3.3) I<sup>2</sup> ≪ J<sup>1</sup> + J2.

In view of [\(2.3\)](#page-2-1), we know  $f_2(\alpha) - f_2^*(\alpha) \ll P_2^{1/2 + \varepsilon}$  $a_2^{1/2+\epsilon}$  for  $\alpha \in \mathfrak{m}_2$ . The argument leading to [\(3.2\)](#page-4-0) also implies

<span id="page-4-2"></span>(3.4) 
$$
\mathcal{J}_1 \ll P_4^{4-\frac{1}{4}+\frac{s-3}{2}+\varepsilon} Z^{1/2} + P_4^{s-\frac{1}{4}+\varepsilon} Z.
$$

One has, by Schwartz's inequality, that

$$
\mathcal{J}_2 \leqslant \Big( \int_{\mathfrak{m}_2} \big| f_4(\alpha)^6 \big| d\alpha \Big)^{1/2} \mathcal{J}^{1/2} \ll P_4^{7/4+\varepsilon} \mathcal{J}^{1/2},
$$

where  $\mathcal J$  is defined as

$$
\mathcal{J} = \int_{\mathfrak{m}_2} \left| f_2^*(\alpha)^4 f_4(\alpha)^{2(s-3)} \mathcal{E}(\alpha)^2 \right| d\alpha.
$$

In order to handle  $\mathcal J,$  we need the following estimate

<span id="page-5-0"></span>(3.5) 
$$
\int_{\mathfrak{m}_2} |f_2^*(\alpha)|^4 |e(-h\alpha)d\alpha = \begin{cases} O(P_4^{4+\epsilon}Y^{-1}), & \text{when } 0 < |h| \leq 2X, \\ O(P_4^{4+\epsilon}), & \text{when } h = 0. \end{cases}
$$

Recalling the definition of  $f_2^*(\alpha)$ , we conclude that

$$
\int_{\mathfrak{m}_2} |f_2^*(\alpha)|^4 |e(-h\alpha)d\alpha
$$
\n
$$
=\sum_{q\leqslant X^{1/2}/2}^* \int_{|\beta|\leqslant \frac{1}{2qX^{1/2}}}^* q^{-4} \Big(\sum_{\substack{a=1\\(a,q)=1}}^q |S_2(q,a)|^4 e(-ha/q)\Big)|v_2(\beta)|^4 e(-h\beta)d\beta,
$$

where the notations  $\sum^*$  and  $\int^*$  mean either  $q > Y$  or  $Xq|\beta| > Y$ . Whenever  $(a, q) = 1$ , one has by Lemma [2.2](#page-3-1) that

$$
|S_2(q, a)| = |S_2(q, 1)| \leq (2q)^{1/2}.
$$

We obtain

$$
\Big| \sum_{\substack{a=1 \\ (a,q)=1}}^q |S_2(q,a)|^4 e(-ha/q) \Big| = |S_2(q,1)|^4 \Big| \sum_{\substack{a=1 \\ (a,q)=1}}^q e(-ha/q) \Big|
$$
  

$$
\leq 4q^2 \Big| \sum_{\substack{a=1 \\ (a,q)=1}}^q e(-ha/q) \Big| \leq 4q^2(q,h),
$$

whence

$$
\int_{\mathfrak{m}_2} |f_2^*(\alpha)|^4 |e(-h\alpha)d\alpha \ll P_2^4 \sum_{q \leq X^{1/2}/2}^* \int_{|\beta| \leq \frac{1}{2qX^{1/2}}}^* \frac{q^{-2}(q,h)}{(1+X|\beta|)^2} d\beta.
$$

When  $h = 0$ , we have

$$
\int_{\mathfrak{m}_2} |f_2^*(\alpha)|^4 |e(-h\alpha)d\alpha \ll P_2^4 \sum_{q \leq X^{1/2}/2} \int_{|\beta| \leq \frac{1}{2qX^{1/2}}} q^{-1} (1+X|\beta|)^{-2} d\beta
$$
  

$$
\ll P_2^4 X^{-1} \log X.
$$

When  $h \neq 0$ , we get

$$
\int_{\mathfrak{m}_2} |f_2^*(\alpha)|^4 |e(-h\alpha)d\alpha \ll P_2^4 Y^{-1} \sum_{q \le X^{1/2}/2} \int_{|\beta| \le \frac{1}{2qX^{1/2}}} \frac{q^{-1}(q,h)}{1+X|\beta|} d\beta
$$
  

$$
\ll P_2^4 Y^{-1} X^{-1} (\log X) \sum_{q \le X^{1/2}/2} q^{-1}(q,h)
$$
  

$$
\ll P_2^4 Y^{-1} X^{-1+\varepsilon}.
$$

The conclusion [\(3.5\)](#page-5-0) is established. Now we are able to estimate  $\mathcal{J}$ . When  $s = 4$ ,

$$
\mathcal{J} = \sum_{\substack{1 \leqslant x_1, x_2 \leqslant P_4 \\ n_1, n_2 \in \mathcal{Z}}} \eta(n_1) \overline{\eta(n_2)} \int_{\mathfrak{m}_2} \left| f_2^*(\alpha)^4 \right| e(- (x_1^4 - x_2^4 + n_1 - n_2) \alpha) d\alpha.
$$

On applying [\(3.5\)](#page-5-0), we can deduce that

$$
\mathcal{J} \ll \sum_{\substack{1 \leq x_1, x_2 \leq P_4, n_1, n_2 \in \mathcal{Z} \\ x_1^4 - x_2^4 + n_1 - n_2 \neq 0}} P_4^{4+\varepsilon} Y^{-1} + \sum_{\substack{1 \leq x_1, x_2 \leq P_4, n_1, n_2 \in \mathcal{Z} \\ x_1^4 - x_2^4 + n_1 - n_2 = 0}} P_4^{4+\varepsilon}
$$
\n
$$
\ll P_4^{6+\varepsilon} Z^2 Y^{-1} + P_4^{4+\varepsilon} Z^2 + P_4^{5+\varepsilon} Z.
$$

Substituting  $Y = P_4^{3/2+\tau} \psi(X)^2$ , we finally obtain

$$
\mathcal{J} \ll P_4^{4+1/2-\tau+\varepsilon} \psi(X)^{-2} Z^2 + P_4^{5+\varepsilon} Z,
$$

whence

$$
\mathcal{J}_2 \ll P_4^{4-\tau/2+\varepsilon} \psi(X)^{-1} Z + P_4^{4+1/4+\varepsilon} Z^{1/2}.
$$

Similarly, when  $s = 3$ , one has

$$
\mathcal{J} \ll P_4^{5/2-\tau+\varepsilon} \psi(X)^{-2} Z^2 + P_4^{4+\varepsilon} Z
$$

whence

$$
\mathcal{J}_2 \ll P_4^{3-\tau/2+\varepsilon} \psi(X)^{-1} Z + P_4^{4-1/4+\varepsilon} Z^{1/2}.
$$

Therefore, we conclude that

<span id="page-6-0"></span>(3.6) 
$$
\mathcal{J}_2 \ll P_4^{4-\frac{1}{4}+\frac{s-3}{2}+\varepsilon} Z^{1/2} + P_4^{s-\tau/2+\varepsilon} \psi(X)^{-1} Z.
$$

Combining  $(3.3)$ ,  $(3.4)$  and  $(3.6)$ , we conclude that

(3.7) 
$$
\mathcal{I}_2 \ll P_4^{4-\frac{1}{4}+\frac{s-3}{2}+\varepsilon} Z^{1/2} + P_4^{s-\tau/2+\varepsilon} \psi(X)^{-1} Z.
$$

We complete the proof.

**Lemma 3.3.** Let  $\mathcal{I}_3$  be defined in  $(3.1)$ *. Then we have* 

$$
\mathcal{I}_3 \ll P_4^{4 - \frac{1}{4} + \frac{s-3}{2} + \varepsilon} Z^{1/2} + P_4^{s - \tau + \varepsilon} \psi(X)^{-1} Z.
$$

*Proof.* Similarly to  $(3.3)$  and  $(3.4)$ , we can derive that

<span id="page-6-1"></span>(3.8) 
$$
\mathcal{I}_3 \ll P_4^{4-\frac{1}{4}+\frac{s-3}{2}+\varepsilon} Z^{1/2} + P_4^{s-\frac{1}{4}+\varepsilon} Z + \mathcal{K},
$$

where

$$
\mathcal{K} = \int_{\mathfrak{m}_3} |f_2^*(\alpha)|^2 f_4(\alpha)^s \mathcal{E}(\alpha)| d\alpha.
$$

One has

$$
\mathcal{K} \leq \sup_{\alpha \in \mathfrak{m}_3} |f_4(\alpha)| \Big( \int_{\mathfrak{m}_3} |f_2^*(\alpha)|^2 f_4(\alpha)^4 | d\alpha \Big)^{1/2} \times \Big( \int_{\mathfrak{m}_3} |f_2^*(\alpha)|^2 f_4(\alpha)^{2(s-3)} \mathcal{E}(\alpha)^2 | d\alpha \Big)^{1/2}.
$$

In view of [\(2.3\)](#page-2-1) and [\(2.4\)](#page-2-2), we have for  $\alpha \in \mathfrak{m}_3$  that

$$
f_4(\alpha) \ll P_4 q^{-1/4} (1 + X|\alpha - a/q|)^{-1/4} + Y^{1/2} X^{\varepsilon} \ll P_4^{3/4 + \tau/2 + \varepsilon} \psi(X).
$$

Since  $f_2^*(\alpha) - f_2(\alpha) \ll P_2^{1/2}$  $2^{1/2}$  for  $\alpha \in \mathfrak{m}_3$ , we easily deduce that

$$
\int_{\mathfrak{m}_3} \left| f_2^*(\alpha)^2 f_4(\alpha)^4 \right| d\alpha \ll P_2^{1/2} \int_0^1 \left| f_2(\alpha) f_4(\alpha)^4 \right| d\alpha + \int_0^1 \left| f_2(\alpha)^2 f_4(\alpha)^4 \right| d\alpha
$$
  
 $\ll P_4^{4+\varepsilon}.$ 

Therefore we arrive at

$$
\mathcal{K} \ll P_4^{11/4+\tau/2+\varepsilon} \psi(X) \Big( \int_{\mathfrak{m}_3} \big| f_2^*(\alpha)^2 f_4(\alpha)^{2(s-3)} \mathcal{E}(\alpha)^2 \big| d\alpha \Big)^{1/2}.
$$

Similarly to [\(3.5\)](#page-5-0), we have the following estimate

<span id="page-7-0"></span>(3.9) 
$$
\int_{\mathfrak{M}(Y)} |f_2^*(\alpha)|^2 |e(-h\alpha)d\alpha = \begin{cases} O(P_4^{\varepsilon}), & \text{when } 0 < |h| \le 2X, \\ O(P_4^{\varepsilon}Y), & \text{when } h = 0. \end{cases}
$$

Note that

$$
\int_{\mathfrak{M}(Y)} |f_2^*(\alpha)|^2 |e(-h\alpha)d\alpha
$$
\n
$$
= \sum_{q \leq Y} \int_{|\beta| \leq \frac{Y}{qX}} q^{-2} \Big( \sum_{\substack{a=1 \\ (a,q)=1}}^q |S_2(q, a)|^2 e(-ha/q) \Big) |v_2(\beta)|^2 e(-h\beta)d\beta
$$
\n
$$
\ll P_2^2 \sum_{q \leq Y} \int_{|\beta| \leq \frac{Y}{qX}} q^{-1}(q, h)(1+X|\beta|)^{-1} d\beta
$$
\n
$$
\ll (\log X) \sum_{q \leq Y} q^{-1}(q, h).
$$

The desired estimate [\(3.9\)](#page-7-0) follows easily from above. For  $s = 4$ , we derive that

$$
\int_{\mathfrak{m}_{3}} |f_{2}^{*}(\alpha)^{2} f_{4}(\alpha)^{2} \mathcal{E}(\alpha)^{2} | d\alpha
$$
\n
$$
\leq \int_{\mathfrak{M}(Y)} |f_{2}^{*}(\alpha)^{2} f_{4}(\alpha)^{2} \mathcal{E}(\alpha)^{2} | d\alpha
$$
\n
$$
= \sum_{\substack{n_{1},n_{2} \in \mathcal{Z} \\ 1 \leq x_{1},x_{2} \leq P_{4}}} \eta(n_{1}) \overline{\eta(n_{2})} \int_{\mathfrak{M}(Y)} |f_{2}^{*}(\alpha)^{2} | e(- (n_{1} - n_{2} + x_{1}^{4} - x_{2}^{4}) \alpha) d\alpha
$$
\n
$$
\ll P_{4}^{2+\epsilon} Z^{2} + P_{4}^{\epsilon} Y (P_{4}^{\epsilon} Z^{2} + P_{4} Z)
$$
\n
$$
\ll (P_{4}^{2+\epsilon} + P_{4}^{3/2+\tau+\epsilon} \psi(X)^{2}) Z^{2} + P_{4}^{5/2+\tau+\epsilon} \psi(X)^{2} Z,
$$

whence

$$
\mathcal{K} \ll (P_4^{15/4+\tau/2+\epsilon}\psi(X) + P_4^{7/2+\tau+\epsilon}\psi(X)^2)Z + P_4^{4+\tau+\epsilon}\psi(X)^2Z^{1/2}.
$$

In particular, we have

$$
K \ll P_4^{4 + \frac{1}{4} + \epsilon} Z^{1/2} + P_4^{4 - \tau + \epsilon} \psi(X)^{-1} Z
$$

provided that  $\psi(X) \ll X^{1/64-\tau}$ . For  $s = 3$ , by [\(3.9\)](#page-7-0) we have

$$
\int_{\mathfrak{m}_3} |f_2^*(\alpha)|^2 \mathcal{E}(\alpha)^2 \Big| d\alpha \ll P_4^{\varepsilon} Z^2 + P_4^{3/2 + \tau + \varepsilon} \psi(X)^2 Z,
$$

whence

$$
\mathcal{K} \ll P_4^{11/4 + \tau/2 + \varepsilon} \psi(X) Z + P_4^{7/2 + \tau + \varepsilon} \psi(X)^2 Z^{1/2}.
$$

When  $\psi(X) \ll X^{1/64-\tau}$ , one has

$$
\mathcal{K} \ll P_4^{4-\frac{1}{4}+\varepsilon} Z^{1/2} + P_4^{3-\tau+\varepsilon} \psi(X)^{-1} Z.
$$

We conclude from above that

<span id="page-8-0"></span>(3.10) 
$$
\mathcal{K} \ll P_4^{4-\frac{1}{4}+\frac{s-3}{2}+\varepsilon} Z^{1/2} + P_4^{s-\tau+\varepsilon} \psi(X)^{-1} Z.
$$

By  $(3.8)$  and  $(3.10)$ , we obtain

(3.11) 
$$
\mathcal{I}_3 \ll P_4^{4-\frac{1}{4}+\frac{s-3}{2}+\varepsilon} Z^{1/2} + P_4^{s-\tau+\varepsilon} \psi(X)^{-1} Z.
$$

We complete the proof.  $\Box$ 

<span id="page-8-1"></span>**Lemma 3.4.** *Let*  $\mathcal{I}_4$  *be defined in*  $(3.1)$ *. Then we have* 

$$
\mathcal{I}_4 \ll ZP_4^{s-(s-2)\nu/4+\varepsilon}.
$$

*Proof.* In view of [\(2.3\)](#page-2-1) and [\(2.4\)](#page-2-2), for  $\alpha \in \mathfrak{M}_{P_4}(q, a)$ , one has

$$
f_4(\alpha) \ll P_4 w_4(q)(1+X|\alpha - a/q|)^{-1/4} + P_4^{1/2+\varepsilon}
$$
  

$$
\ll P_4^{1+\varepsilon} w_4(q)(1+X|\alpha - a/q|)^{-1/4},
$$

and

$$
f_2(\alpha) \ll P_2 q^{-1/2} (1 + X|\alpha - a/q|)^{-1/2}.
$$

Therefore we obtain

$$
\mathcal{I}_4 \ll Z \sup_{\alpha \in \mathfrak{m}_4} |f_4(\alpha)|^{s-2} \int_{\mathfrak{M}(P_4)} |f_4(\alpha)f_2(\alpha)|^2 d\alpha
$$
  
\$\ll ZP\_4^{(s-2)(1-\nu/4)+\varepsilon}P\_4^2 P\_2^2 \sum\_{q \leq P\_4} w\_4(q)^2 \int\_{|\beta| \leq \frac{P\_4}{qX}} (1+X|\beta|)^{-3/2} d\beta\$  
\$\ll ZP\_4^{2+(s-2)(1-\nu/4)+\varepsilon} \sum\_{q \leq P\_4} w\_4(q)^2.

In light of Lemma 2.4 by Kawada and Wooley [\[7\]](#page-10-10), one can conclude that

(3.12) 
$$
\mathcal{I}_4 \ll Z P_4^{2 + (s-2)(1-\nu/4) + \varepsilon} \ll Z P_4^{s-(s-2)\nu/4 + \varepsilon}.
$$

The desired estimate is established.  $\Box$ 

*Proof of Theorem [1.1.](#page-1-0)* We denote by  $Z_s(X)$  the set of integers n with  $X/2$  <  $n \leqslant X$  for which the lower bound

$$
\left| R_s(n) - c_s \Gamma(\frac{5}{4})^4 \mathfrak{S}_s(n) n^{s/4} \right| > n^{s/4} \psi(n)^{-1}
$$

holds, and we abbreviate  $card(Z_s(X))$  to  $Z_s$ . It follows from [\(2.1\)](#page-2-3) and Lemma [2.1](#page-3-2) that for  $n \in Z_s(X)$ ,

$$
\left| \int_{\mathfrak{m}} f_2(\alpha)^2 f_4(\alpha)^s e(-n\alpha) d\alpha \right| \gg X^{s/4} \psi(X)^{-1},
$$

whence

$$
\sum_{n\in Z_s(X)} \left| \int_{\mathfrak{m}} f_2(\alpha)^2 f_4(\alpha)^s e(-n\alpha) d\alpha \right| \gg Z_s X^{s/4} \psi(X)^{-1}.
$$

We choose complex numbers  $\eta(n)$ , with  $|\eta(n)| = 1$ , satisfying

$$
\left| \int_{\mathfrak{m}} f_2(\alpha)^2 f_4(\alpha)^s e(-n\alpha) d\alpha \right| = \eta(n) \int_{\mathfrak{m}} f_2(\alpha)^2 f_4(\alpha)^s e(-n\alpha) d\alpha.
$$

Then we define the exponential sum  $\mathcal{E}_s(\alpha)$  by

$$
\mathcal{E}_s(\alpha) = \sum_{n \in Z_s(X)} \eta(n) e(-n\alpha).
$$

One finds that

<span id="page-9-0"></span>(3.13) 
$$
Z_s X^{s/4} \psi(X)^{-1} \ll \int_{\mathfrak{m}} |f_2(\alpha)|^2 f_4(\alpha)^s \mathcal{E}_s(\alpha)| d\alpha.
$$

Note that  $\mathfrak{m} = \mathfrak{m}_1 \cup \mathfrak{m}_2 \cup \mathfrak{m}_3 \cup \mathfrak{m}_4$ . Now we conclude from Lemmata [3.1-](#page-3-3)[3.4](#page-8-1) and [\(3.13\)](#page-9-0) that

$$
Z_s X^{s/4} \psi(X)^{-1} \ll P_4^{4 - \frac{1}{4} + \frac{s-3}{2} + \varepsilon} Z_s^{1/2} + P_4^{s - \delta} \psi(X)^{-1} Z_s
$$

for some sufficiently small positive number  $\delta$ . Therefore we have

<span id="page-10-11"></span>(3.14) 
$$
Z_s X^{s/4} \psi(X)^{-1} \ll X^{1 - \frac{1}{16} + \frac{s-3}{8} + \varepsilon} Z_s^{1/2}.
$$

The estimate [\(3.14\)](#page-10-11) implies  $Z_3 \ll X^{3/8+\epsilon}\psi(X)^2$  and  $Z_4 \ll X^{1/8+\epsilon}\psi(X)^2$ . The proof of Theorem [1.1](#page-1-0) is completed by summing over dyadic intervals.  $\Box$
