Kinematic & Dynamic Analysis of the Human Upper Limb Using the Theory of Screws

Screw theory provides geometrical insight into the mechanics of rigid bodies. Screw axis is defined as the line coinciding with the joint axis. Line transformations in the form of a screw operator are used to determine the joint axes of a seven degree of freedom manipulator, representing the human upper limb. Multiplication of a unit screw axis with the joint angular velocity provides the joint twist. Instantaneous motion of a joint is the summation of the twists of the preceding joints and the joint twist itself. Inverse kinematics, velocities and accelerations are calculated using the screw Jacobian for a non-redundant six degree of freedom manipulator. Newton and Euler dynamic equations are then utilized to solve for the forward and inverse dynamic problems.

Dynamics of the upper limb and the upper limb combined with an exoskeleton are only different due to the additional mass and inertia of the exoskeleton. Dynamic equations are crucial for controlling the exoskeleton in position and force.

1. Introduction

Intelligent and sophisticated robots are emerging in every aspect of our lives. In the past few decades, researchers have been looking for ways to incorporate robotics with humans. Majority of these efforts have had the goal of benefiting human motion or medical rehabilitation in mind [4].

The earliest work cited by most reviewers is a powered arm orthosis with four degrees of freedom developed by CASE institute of technology in the early 1960's [4]. The CASE manipulator was capable of performing pre-recorded tasks in a sequence designed by a physiotherapist, without any feedback from the device. Similar exoskeletons targeting tele-operation [6], assistance and power augmentation [7] have been developed. Exoskeleton-based assistive devices are also a viable substitute for wheeled vehicles as they allow their users to traverse irregular terrain surfaces [5].

More recently integration of electronic sensors, specifically electromyography (EMG) sensor, has shed light into the possibility of building autonomous assistive robots [10] since normalized EMG activation levels correspond to muscle activity [9].

More advanced robotic systems that are capable of assisting patients with their daily living tasks (such as stroke or nerve disorder patients who are dependent on other) are sought after; robots that can intelligently detect the intention of patient and assist them with movements, making them independent of others.

A robotic exoskeleton capable of providing torque, to a patient's wrist (2 DOF) has already been designed and developed in Menrva lab (The school of engineering science, Simon Fraser

University) [12],[13]. A comprehensive device, supporting all seven degrees of freedom of the human upper limb is the ultimate goal of the project and further research is being carried out in order to extend the existing system.

Since the device is to be fixed to the upper limb and its joints would be corresponding to those of the human, kinematics of the upper limb with or without the exoskeleton remain unchanged. However the dynamics will differ due to mass and inertia changes that the exoskeleton introduces.

Kinematics and dynamics of a generic seven degrees of freedom manipulator, representing either the upper limb or the upper limb and exoskeleton combination are to be analyzed. Parametric formulation for both cases is the same. Specific equations can be derived by plugging-in proper inertial parameters.

2. Forward Kinematics

The upper limb consists of three segments: arm, forearm and the hand respectively from the proximal to the distal end. The arm is connected to the torso through a three degree of freedom ball and socket joint. The arm is connected to the forearm through the elbow joint (one degree of freedom) and the forearm is connected to the hand through the wrist joint that possesses three degrees of freedom.

The upper limb can be considered a spatial manipulator. A link in a manipulator is a member that connects the adjacent joints such that when the whole manipulator is in motion the relative location of the two joints does not change. The three links in the manipulator correspond to the arm, forearm and hand.

Figure 1. Upper limb kinematic model.

Table 1. Description of joints in figure 1.

Joint Axis	Joint Description
Shoulder	
1	Arm adduction/abduction
2	Arm circumduction
3	Arm extension/flexion
Elbow	
4	Forearm extension/flexion
Wrist	
5	Ulnar/Redial deviation
6	Forearm supination/pronation
7	Wrist extension/flexion

Figure 2. Rotation about joint axis.

The kinematic model of the human upper limb is constructed based on the method presented in [1]. The method is based on displacement of joint and link axes using screw operators.

Axis of rotation in each of the joints is denoted by screw axis \hat{S}_i^* where $i = 1, 2, \dots, 7$. Figure 1 illustrates the upper limb kinematic model with all joint angles set to zero. Table 1 describes the joint axes corresponding to figure 1.

Each of the joint axes are assigned a screw (\hat{S}_1^* through \hat{S}_7^*) that is in essence a line coinciding with the axes. Link axes are lines containing the shortest perpendicular distance between links (\hat{a}_{12}^* through \hat{a}_{78}^*). For instance \hat{a}_{34}^* is a line coinciding with the shortest perpendicular distance between joints 3 and 4. Vector product of screws \hat{S}_i^* and \hat{a}_{ij}^* ($j = i + 1$) results in another screw, completing a coordinate system:

$$\hat{y}_i^* = \hat{S}_i^* \times \hat{a}_{ij}^* \quad (1)$$

The fixed reference frame $\{0\}$ is connected to the shoulder and is taken as the universal reference frame of the system where all succeeding reference frames are defined based upon. The reference frame $\{0\}$ is constructed from the three fixed screws \hat{a}_{01}^* , \hat{y}_0^* and \hat{S}_0^* corresponding to i, j and k .

Figure 2 depicts how rotation about the joint axes results in rotation of the succeeding coordinate system. In the illustration, rotating θ_1 radians about \hat{S}_0^* results in new position for screws \hat{a}_{12}^* and \hat{y}_1^* .

Reference frames composed of the joint axes, link axes and their vector product are attached to each joint in the kinematic model. Rotation angle about joint axes and link lengths alter the position and orientation of reference frames with respect to the universal coordinate system. Figure 3 shows attachment of reference frames to the upper limb.

Every link in the manipulator is defined by the dual angle $\hat{\alpha}_{ij} = \alpha_{ij} + \varepsilon a_{ij}$ where the primary part, α_{ij} , is the projected angle between the two axes that the link is placed in between. The dual part a_{ij} is the shortest distance between the two joint axes. Since the upper limb has only three segments (links), imaginary links of lengths zero were assumed to be connected to frames $\{1\}$, $\{2\}$, $\{5\}$ and $\{6\}$.

All of the joints in the upper limb are of the revolute type. A rotary pair or revolute joint solely allows rotation about the screw axis \hat{S}_i^* . The relative location of the links connected by the revolute joint (\hat{a}_{ij}^* and \hat{a}_{jk}^* where $j = i + 1$ and $k = j + 1$) is specified using the dual angle $\hat{\theta}_j = \theta_j + \varepsilon s_j$ where the primary part, θ_j , is the projected angle between the two links and the dual part, s_j , is the distance between links. Dual angles for the kinematic model are tabulated in table 2.

Table 2. Link and joint parameters for the kinematic model.

Link parameters		Joint Parameters	
Link 1 (Imaginary)	$\hat{\alpha}_{12} = -\frac{\pi}{2}$	Joint 1	$\hat{\theta}_1 = \theta_1$
Link 2 (Imaginary)	$\hat{\alpha}_{23} = -\frac{\pi}{2}$	Joint 2	$\hat{\theta}_2 = -\frac{\pi}{2} + \theta_2$
Link 3 (Arm)	$\hat{\alpha}_{34} = \varepsilon l_1$	Joint 3	$\hat{\theta}_3 = -\frac{\pi}{2} + \theta_3$
Link 4 (Forearm)	$\hat{\alpha}_{45} = -\frac{\pi}{2} + \varepsilon l_2$	Joint 4	$\hat{\theta}_4 = \theta_4$
Link 5 (Imaginary)	$\hat{\alpha}_{56} = -\frac{\pi}{2}$	Joint 5	$\hat{\theta}_5 = -\frac{\pi}{2} + \theta_5$
Link 6 (Imaginary)	$\hat{\alpha}_{67} = -\frac{\pi}{2}$	Joint 6	$\hat{\theta}_6 = -\frac{\pi}{2} + \theta_6$
Link 7 (Hand)	$\hat{\alpha}_{78} = -\frac{\pi}{2}$	Joint 7	$\hat{\theta}_7 = -\frac{\pi}{2} + \theta_7$

The seven unit line vectors representing the screw axes (joint axes) and seven unit line vectors representing the link axes are determined using the following relationships [1]:

$$\hat{S}_i^* = Q_{ij}^* \hat{S}_j^* \quad (2)$$

$$Q_{ij}^* = \cos \hat{\alpha}_{ij} + \hat{a}_{ij}^* \sin \hat{\alpha}_{ij} \quad (ij = 12, 23, \dots, 78) \quad (3)$$

$$\hat{a}_{ki}^* = Q_k^* \hat{a}_{jk}^* \quad (k, i, j = 2, 3, 1; 3, 4, 2; \dots; 7, 8, 6) \quad (4)$$

$$Q_k^* = \cos \hat{\theta}_k + \hat{S}_k^* \sin \hat{\theta}_k \quad (5)$$

The universal reference frame is defined as,

$$\hat{a}_{01}^* = i \quad (6)$$

$$\hat{y}_0^* = j \quad (7)$$

$$\hat{S}_0^* = k \quad (8)$$

Reference frame $\{1\}$, is therefore derived as

$$Q_{01}^* = \cos(0) + i \sin(0) = 1 \quad (9)$$

$$\hat{S}_1^* = Q_{01}^* \hat{S}_0^* = 1(k) = k \quad (10)$$

$$Q_1^* = \cos \theta_1 + \sin \theta_1 k \quad (11)$$

$$\hat{a}_{12}^* = Q_1^* \hat{a}_{01}^* = (\cos \theta_1 + k \sin \theta_1) i = \cos \theta_1 i + \sin \theta_1 j \quad (12)$$

$$\hat{y}_1^* = \hat{S}_1^* \hat{a}_{12}^* = -\sin \theta_1 i + \cos \theta_1 j \quad (13)$$

Derivation of the unit screw axes to construct the rest of the reference frames follows an identical procedure. Computed screw axes can be found in Appendix A.

Figure 3. (a) Upper limb top view and joint axes. (b) Corresponding reference frames attached to the upper limb.

3. Inverse Kinematics

A line in space can be defined using two distinct points $p_1 = (x_1, y_1, z_1)$ and $p_2 = (x_2, y_2, z_2)$ (see Figure 4).

Figure 4. Defining a line in the three dimensional space using two distinct points.

The unique line passing through two distinct points can be defined using the Plücker line coordinates outlined below:

$$\bar{S} = [L \ M \ N]^T = [x_2 - x_1 \ y_2 - y_1 \ z_2 - z_1]^T \quad (14)$$

$$\bar{S}_0 = [P \ Q \ R]^T \quad (15)$$

$$P = y_1 N - z_1 M \quad (15.a)$$

$$Q = z_1 L - x_1 N \quad (15.b)$$

$$R = x_1 M - y_1 L \quad (15.c)$$

The six parameters of Plücker line coordinates correspond to dual vector coordinates of a screw axis,

$$\hat{S} = \bar{S} + \varepsilon \bar{S}_0 = [\bar{S} \ \bar{S}_0]^T \quad (16)$$

$$\bar{S} = [L \ M \ N]^T \quad (17)$$

$$\bar{S}_0 = [P \ Q \ R]^T \quad (18)$$

The human upper limb is a redundant manipulator. Redundancy allows the hand to assume infinite orientations in all positions except for the singular ones within its working space, defined by joint ranges of motion.

Due to the aforementioned redundancy, knowledge of the desired hand (end-effector) position and orientation would not allow us to uniquely determine the joint angles. The last degree of freedom (rotation about joint axis \hat{S}_7^*) is therefore omitted.

The position and orientation of the end-effector can be determined using a line that goes through the joint axis \hat{S}_7^* . Two distinct points are needed to define the six line parameters in equations (14) and (15).

The set of six equations necessary for solving unique joint angles $(\theta_1, \theta_2, \dots, \theta_6)$ are provided in Appendix B.

4. Twists and Acceleration Screws

Twists are computed as the multiplication of the joint angular velocity with the unit screw axis. Twists are therefore oftentimes referred to as the intensity of the screw axis [13]. Twist of the screw axis i is therefore computed as:

$$\hat{T}_i = \dot{\theta}_i \hat{S}_i^* \quad (19)$$

However due to the fact that the motion of preceding joints affects the motion of succeeding links, instantaneous motion of each joint needs to take into account the preceding twists. The instantaneous motion of screw axis n is computed as follows:

$$\bar{I}\hat{M}_n = \sum_{i=1}^n \dot{\theta}_i \hat{S}_i^* \quad (20)$$

Acceleration screws can be determined by computing explicit derivative of twists:

$$\hat{A}_i = \dot{\hat{T}}_i \quad (21)$$

Similar to twists, acceleration screws don't take into account the accelerations of preceding frames. The instantaneous acceleration of screw n is therefore computed as:

$$\bar{I}\hat{A}_n = \sum_{i=1}^n \dot{\hat{T}}_i \quad (22)$$

Instantaneous motion and acceleration of screws 1 and 2 are computed below:

$$\bar{I}\hat{M}_1 = \dot{\theta}_1 \hat{S}_1^* = \dot{\theta}_1 k \quad (23)$$

$$\bar{I}\hat{A}_1 = \dot{\bar{I}\hat{M}}_1 = \ddot{\theta}_1 k \quad (24)$$

$$\bar{I}\hat{M}_2 = \dot{\theta}_1 \hat{S}_1^* + \dot{\theta}_2 \hat{S}_2^* = -\sin\theta_1 \dot{\theta}_2 i + \cos\theta_1 \dot{\theta}_2 j + \dot{\theta}_1 k \quad (25)$$

$$\bar{I}\hat{A}_2 = \dot{\bar{I}\hat{M}}_2 = (-c\theta_1 \dot{\theta}_1 \dot{\theta}_2 - s\theta_1 \ddot{\theta}_2) i + (-s\theta_1 \dot{\theta}_1 \dot{\theta}_2 + c\theta_1 \ddot{\theta}_2) j + \ddot{\theta}_1 k \quad (26)$$

Derivation of instantaneous motion and acceleration for the rest of the screw axes follows an identical procedure (Appendix C).

5. Inverse Velocities and Accelerations

The instantaneous motion of the last joint (manipulator end-effector), is dependent on joint angular velocities and the screw Jacobian [2],

$$\widehat{IM}_7 = \widehat{J}[\dot{\theta}_1 \ \dot{\theta}_2 \ \dot{\theta}_3 \ \dot{\theta}_4 \ \dot{\theta}_5 \ \dot{\theta}_6 \ \dot{\theta}_7]^T \quad (27)$$

Where the screw Jacobian, \widehat{J} , is a 6×7 matrix where columns 1 through 7 correspond to screws \widehat{S}_1^* through \widehat{S}_7^* :

$$J = [\widehat{S}_1^* \ \widehat{S}_2^* \ \widehat{S}_3^* \ \widehat{S}_4^* \ \widehat{S}_5^* \ \widehat{S}_6^* \ \widehat{S}_7^*] \quad (28)$$

Since the Jacobian is not square and hence not invertible, in order to solve the inverse problem, one degree of freedom needs to be omitted, which in turn reduces one column. Omitting the last degree of freedom, namely wrist flexion and extension, results in a square Jacobian,

$$J = [\widehat{S}_1^* \ \widehat{S}_2^* \ \widehat{S}_3^* \ \widehat{S}_4^* \ \widehat{S}_5^* \ \widehat{S}_6^*] \quad (29)$$

Consequently the joint velocities given the end-effector instantaneous motion is computed as:

$$[\dot{\theta}_1 \ \dot{\theta}_2 \ \dot{\theta}_3 \ \dot{\theta}_4 \ \dot{\theta}_5 \ \dot{\theta}_6]^T = J^{-1} \widehat{IM}_6 \quad (30)$$

It is important to note that because the last degree of freedom has been omitted, instantaneous motion of joint 6 is being considered. Knowledge of joint angles is necessary to solve for the inverse velocities.

End-effector instantaneous acceleration is computed as,

$$\widehat{IA}_7 = \widehat{j}\ddot{\theta} + J\ddot{\theta} \quad (31)$$

$$\ddot{\theta} = [\ddot{\theta}_1 \ \ddot{\theta}_2 \ \ddot{\theta}_3 \ \ddot{\theta}_4 \ \ddot{\theta}_5 \ \ddot{\theta}_6 \ \ddot{\theta}_7]^T \quad (32)$$

$$\ddot{\theta} = [\ddot{\theta}_1 \ \ddot{\theta}_2 \ \ddot{\theta}_3 \ \ddot{\theta}_4 \ \ddot{\theta}_5 \ \ddot{\theta}_6 \ \ddot{\theta}_7]^T \quad (33)$$

Since the Jacobian is not square and hence not invertible, in order to solve the inverse problem, one degree of freedom needs to be omitted, which in turn reduces one column. Omitting the last degree of freedom, namely wrist flexion and extension, results in a square Jacobian,

$$J = [\widehat{S}_1^* \ \widehat{S}_2^* \ \widehat{S}_3^* \ \widehat{S}_4^* \ \widehat{S}_5^* \ \widehat{S}_6^*] \quad (34)$$

Joint angular accelerations, given the end-effector instantaneous acceleration is computed as

$$\ddot{\theta} = J^{-1} [\widehat{j}\ddot{\theta} - \widehat{IA}_6] \quad (35)$$

Knowledge of joint angles and angular velocities is necessary to compute joint accelerations; provided the desired end-effector accelerations (Appendix D).

6. Forward Dynamics

Coordinate systems $\{3\}$, $\{4\}$ and $\{7\}$ are connected to the arm, forearm and hand respectively.

Coordinate system $\{3\}$ represents the orientation of the ball-and-socket shoulder joint that possesses three degrees of freedom. Joint angles θ_1 , θ_2 and θ_3 define the ultimate orientation of frame $\{3\}$.

Coordinate system $\{4\}$ represents the elbow joint and is of a single degree of freedom. However it should be noted that the orientation of frame $\{3\}$, arm length and the joint angle θ_4 dictate the position and orientation of frame $\{4\}$ cumulatively.

Coordinate system $\{7\}$ is attached to the wrist joint and all the joint angles, arm and forearm length determine its orientation and position in space. Frame $\{7\}$ is also considered to be the end-effector of the manipulator.

Since coordinate systems are attached to bodies, angular and linear velocities and acceleration of the attachment point of bodies and coordinate systems are identical.

Dynamic properties of the three bodies, namely the arm, forearm and the hand, are tabulated in table 2.

In the forward dynamics case, the knowledge of reaction forces, applied torques on joints, joint angles and joint velocities

is assumed. Dynamic equations of the three bodies are then solved to obtain acceleration screws of each reference frame.

Table 3. Dynamic properties of the upper limb.

Property	Arm (Body 1)	Forearm (Body 2)	Hand (Body 3)
Mass	m_1	m_2	m_3
Moment of inertia	I_1	I_2	I_3
Length	l_1	l_2	l_3
Center of mass position in the corresponding reference frame	G_3	G_4	G_7
Gravitational acceleration	g		

Instantaneous motion and acceleration of bodies at the point of attachment to the reference frame, equals the instantaneous motion and acceleration of the reference frame.

$$\widehat{IM}_i = \bar{\omega}_i + \varepsilon \bar{V}_i = (\omega_i + \varepsilon V_i) \widehat{s}_{iMI} \quad (i = 3,4,7) \quad (36)$$

$$\widehat{IA}_i = \bar{\alpha}_i + \varepsilon \bar{a}_i = (\alpha_i + \varepsilon a_i) \widehat{s}_{iAI} \quad (i = 3,4,7) \quad (37)$$

Where the primary parts ($\bar{\omega}_i$ and $\bar{\alpha}_i$) are the angular velocities and acceleration and the dual parts (\bar{V}_i and \bar{a}_i) are the linear velocities and accelerations.

\widehat{s}_{iMI} is the screw axis that the angular velocity of the body about it is ω_i , and linear velocity along it is V_i (ω_i and V_i are numbers). \widehat{s}_{iAI} is the screw axis that the angular acceleration of the body about it is α_i , and linear velocity along it is a_i (α_i and a_i are numbers).

The linear momentum of the three bodies relative to the attachment point of each body can be written as [3],

$$\bar{q}_i = m_j (\bar{V}_i + \bar{\omega}_i \times \bar{G}_i) \quad (i, j = 3,1; 4,2; 7; 3) \quad (38)$$

Where \bar{G}_3 , \bar{G}_4 and \bar{G}_7 are the location of center of mass in reference frames 3, 4 and 7 respectively,

$$\bar{G}_i = [l_j/2 \ 0 \ 0]^T \quad (i, j = 3,1; 4,2; 7; 3) \quad (39)$$

The angular momentum of the three bodies relative to the attachment point of each body can be written as,

$$\bar{H}_i = I_j \bar{\omega}_i + m_j (\bar{G}_i \times \bar{V}_i) \quad (i, j = 3,1; 4,2; 7; 3) \quad (40)$$

Dynamic model of the upper limb is shown in figure 6. Forces, torques and attached reference frames are shown in the figure.

Gravitational forces of bodies 1, 2 and 3 in reference frame $\{0\}$ are shown below:

$${}^0\bar{F}_{mi} = [0 \ 0 \ -m_i g]^T \quad (i = 1,2,3) \quad (41)$$

It is desirable to compute these values in their corresponding reference frames. ${}^3\bar{F}_{m1}$, ${}^4\bar{F}_{m2}$ and ${}^7\bar{F}_{m3}$ are the gravitational forces in reference frames $\{3\}$, $\{4\}$ and $\{7\}$. Calculations can be found in Appendix E.

Figure 5. Free body diagram of the hand (body 3).

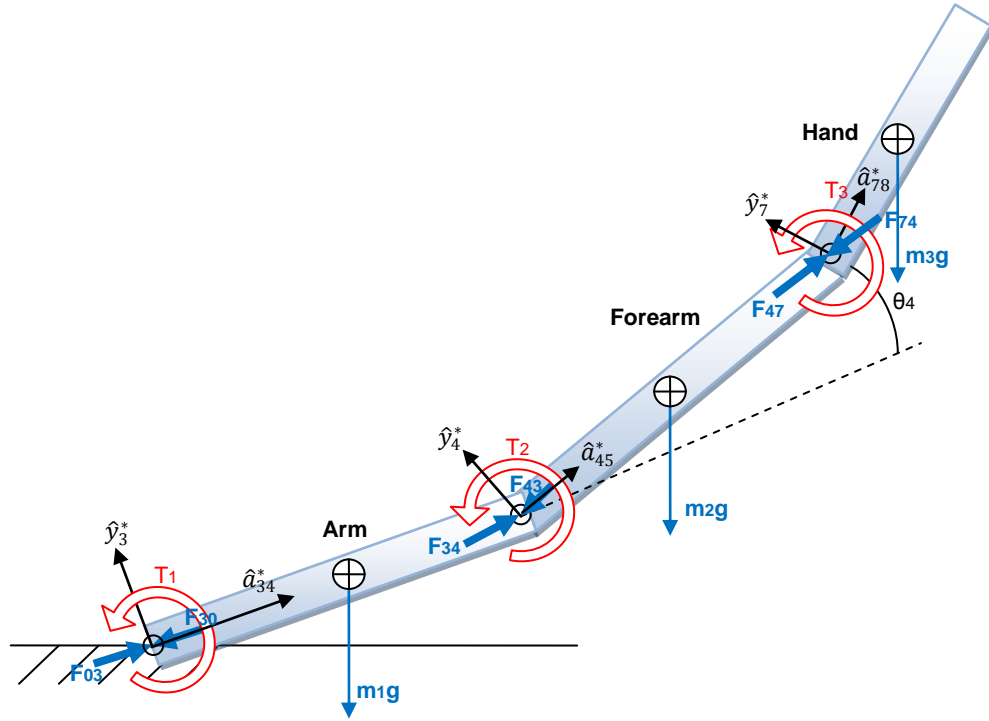

Figure 6. Dynamic model of the human upper limb.

Free body diagram for body 3 (hand) is depicted in figure 5. The summation of external forces and moments on this body are,

$$\bar{F}_7 = \bar{F}_{47} + \bar{F}_{m3} \quad (42)$$

$$\bar{M}_7 = \bar{T}_3 + \bar{G}_7 \times \bar{F}_{m3} \quad (43)$$

Free body diagram for body 2 (forearm) is depicted in figure 7. The summation of external forces and moments on this body are,

$$\bar{F}_4 = \bar{F}_{74} + \bar{F}_{34} + \bar{F}_{m2} \quad (44)$$

$$\bar{M}_4 = \bar{T}_2 + \bar{G}_4 \times \bar{F}_{m2} + [l_2 \quad 0 \quad 0]^T \times \bar{F}_{74} \quad (45)$$

Figure 7. Free body diagram of the forearm (body 2).

Free body diagram for body 1 (arm) is depicted in figure 8. The summation of external forces and moments on this body are,

$$\bar{F}_3 = \bar{F}_{03} + \bar{F}_{43} + \bar{F}_{m1} \quad (46)$$

$$\bar{M}_3 = \bar{T}_1 + \bar{G}_3 \times \bar{F}_{m1} + [l_1 \quad 0 \quad 0]^T \times \bar{F}_{43} \quad (47)$$

Figure 8. Free body diagram of the arm (body 1).

Joint reaction forces applied by the adjacent links are equal in magnitude and opposite in sense,

$$\bar{F}_{74} = -\bar{F}_{47} \quad (48)$$

$$\bar{F}_{43} = -\bar{F}_{34} \quad (49)$$

$$\bar{F}_{30} = -\bar{F}_{03} \quad (50)$$

Newton and Euler equations with respect to the reference frames are written as,

$$\bar{F}_i = \dot{\bar{q}}_i + \bar{\omega}_i \times \bar{q}_i \quad (i = 3,4,7) \quad (51)$$

$$\bar{M}_i = \dot{\bar{H}}_i + \bar{\omega}_i \times \bar{H}_i + \bar{V}_i \times \bar{q}_i \quad (i = 3,4,7) \quad (52)$$

Equations (51) and (52) are expanded to reach to the following equations,

$$\bar{F}_i = m_j (\bar{a}_i + \bar{a}_i \times \bar{G}_i) + \bar{\omega}_i \times \bar{q}_i \quad (ij = 3,1; 4,2; 7,3) \quad (53)$$

$$\bar{M}_i = I_j \alpha_i + m_j (\bar{G}_i \times \bar{a}_i) + \bar{\omega}_i \times \bar{H}_i + \bar{V}_i \times \bar{q}_i \quad (54)$$

The six dynamic equations are simultaneously solved to find the values \bar{a}_3 , \bar{a}_4 , \bar{a}_7 , $\bar{\alpha}_3$, $\bar{\alpha}_4$ and $\bar{\alpha}_7$. See Appendix F for complete solutions.

7. Inverse Dynamics

Given the angular acceleration of joints, Newton and Euler equations for the three bodies are solved to determine the reaction forces and joint torques.

Equations unknowns are \bar{F}_{47} , \bar{T}_3 , \bar{F}_{74} , \bar{F}_{34} , \bar{T}_2 , \bar{F}_{43} , \bar{F}_{03} , \bar{T}_1 and \bar{F}_{30} . Equations (48)-(50) introduce dependencies amongst variables; reducing the number of unknowns to 6.

Full computation of reaction forces and joint torques are provided in Appendix G.

8. Conclusions

Forward and inverse kinematics and dynamics of a 7 degree of freedom manipulator resembling the human upper limb or the upper limb and exoskeleton combination, were analysed. The advantage of using the screw theory is the geometrical insight it provides to motion of bodies that provides a more intuitive perspective on the motion of bodies.

Appendix B: Inverse Kinematics Equations

Plücker line coordinates of the desired end-effector joint axis (\hat{S}_7^*) are conveniently derived if a vector representing the orientation, \bar{S} , and a point on the axis, \bar{p} , are known.

$$\begin{aligned}\bar{S} &= [L \quad M \quad N]^T \\ \bar{p} &= [x_1 \quad y_1 \quad z_1]^T \\ \hat{S}_0 &= [P \quad Q \quad R]^T \\ P &= y_1 N - z_1 M \\ Q &= z_1 L - x_1 N \\ R &= x_1 M - y_1 L\end{aligned}$$

The analytical expression for \hat{S}_6^* was derived in Appendix A. The following equations need to be solved simultaneously to obtain joint angles $\theta_1, \theta_2, \dots, \theta_6$,

$$\hat{S}_6^* - [L \quad M \quad N \quad P \quad Q \quad R]^T = 0$$

Expanding the above equation into six equations,

- (1) $-c\theta_2 s\theta_5 c\theta_1 + c\theta_5 s\theta_2 c\theta_4 s\theta_3 c\theta_1 - c\theta_5 c\theta_4 c\theta_3 s\theta_1 + c\theta_5 s\theta_4 s\theta_3 s\theta_1 + c\theta_5 s\theta_2 s\theta_4 c\theta_3 c\theta_1 - L = 0$
- (2) $c\theta_5 s\theta_2 c\theta_4 s\theta_3 s\theta_1 + c\theta_5 c\theta_4 c\theta_3 c\theta_1 - c\theta_5 s\theta_4 s\theta_3 c\theta_1 + c\theta_5 s\theta_2 s\theta_4 c\theta_3 s\theta_1 - c\theta_2 s\theta_5 s\theta_1 - M = 0$
- (3) $s\theta_5 s\theta_2 + c\theta_5 c\theta_2 c\theta_4 s\theta_3 + c\theta_5 c\theta_2 s\theta_4 c\theta_3 - N = 0$
- (4) $s\theta_5 11 s\theta_3 s\theta_1 + s\theta_5 11 s\theta_2 c\theta_3 c\theta_1 + s\theta_5 c\theta_4 s\theta_3 s\theta_1 12 + s\theta_5 s\theta_4 c\theta_3 s\theta_1 12 + s\theta_2 s\theta_5 c\theta_4 c\theta_3 c\theta_1 12 - s\theta_2 s\theta_5 s\theta_4 s\theta_3 c\theta_1 12 + c\theta_2 c\theta_5 11 c\theta_1 s\theta_4 - P = 0$
- (5) $c\theta_2 c\theta_5 11 s\theta_1 s\theta_4 - s\theta_5 c\theta_4 s\theta_3 c\theta_1 12 - s\theta_5 s\theta_4 c\theta_3 c\theta_1 12 + s\theta_2 s\theta_5 c\theta_4 c\theta_3 s\theta_1 12 - s\theta_2 s\theta_5 s\theta_4 s\theta_3 s\theta_1 12 - s\theta_5 11 s\theta_3 c\theta_1 + s\theta_5 11 s\theta_2 c\theta_3 s\theta_1 - Q = 0$
- (6) $-c\theta_5 11 s\theta_2 s\theta_4 + s\theta_5 11 c\theta_2 c\theta_3 + c\theta_2 s\theta_5 c\theta_4 c\theta_3 12 - c\theta_2 s\theta_5 s\theta_4 s\theta_3 12 - R = 0$

Appendix D: The Screw Jacobian, Inverse Jacobian and Jacobian's Derivative

The screw Jacobian is found by plugging in the analytical expressions of column screw axes \hat{S}_1^* through \hat{S}_6^* in the following equation,

$$J = [\hat{S}_1^* \quad \hat{S}_2^* \quad \hat{S}_3^* \quad \hat{S}_4^* \quad \hat{S}_5^* \quad \hat{S}_6^*]$$

Derivative of the Jacobian is carried out by taking the explicit derivative of the screw Jacobian,

$$\dot{J} = [\dot{J}_1 \quad \dot{J}_2 \quad \dot{J}_3 \quad \dot{J}_4 \quad \dot{J}_5 \quad \dot{J}_6]$$

θ_i : Joint i angle ($i=1,2,\dots,7$)

w_i : Joint i angular velocity ($i=1,2,\dots,7$)

l_i : Link i length ($i=1,2$)

$$\dot{J}_1 = [0, 0, 0, 0, 0, 0]$$

$$\dot{J}_2 = [-w_1 c \theta_1, -w_1 s \theta_1, 0, 0, 0, 0]$$

$$\dot{J}_3 = [-w_1 c \theta_2 s \theta_1 - w_2 s \theta_2 c \theta_1 w_1 c \theta_2 c \theta_1 - w_2 s \theta_2 s \theta_1, -w_2 c \theta_2, 0, 0, 0, 0]$$

$$\dot{J}_4 = [-w_1 c \theta_2 s \theta_1 - w_2 s \theta_2 c \theta_1, w_1 c \theta_2 c \theta_1 - w_2 s \theta_2 s \theta_1, -w_2 c \theta_2, -w_1 l_1 s \theta_3 c \theta_1 - s \theta_2 c \theta_3 s \theta_1 - w_2 l_1 c \theta_2 c \theta_3 c \theta_1 - w_3 l_1 s \theta_1 c \theta_3 - s \theta_2 s \theta_3 c \theta_1, w_1 l_1 - s \theta_1 s \theta_3 - s \theta_2 c \theta_3 c \theta_1 - w_2 l_1 c \theta_2 c \theta_3 s \theta_1 + w_3 l_1 c \theta_3 c \theta_1 + s \theta_2 s \theta_3 s \theta_1, w_2 l_1 s \theta_2 c \theta_3 + w_3 l_1 c \theta_2 s \theta_3]$$

 \end{array} \right.$$

Appendix E: Inverse Dynamics

The following six equations are solved in order of their appearance to obtain joint reaction forces and torques,

$$\left\{ \begin{array}{l}
 \bar{F}_{47} = m_3(\bar{a}_7 + \bar{\alpha}_7 \times \bar{G}_7) + \bar{\omega}_7 \times \bar{q}_7 - \bar{F}_{m3} \\
 \bar{T}_3 = I_1\alpha_3 + m_1(\bar{G}_3 \times a_3) + \bar{\omega}_3 \times \bar{H}_3 + \bar{V}_3 \times \bar{q}_3 - \bar{G}_7 \times \bar{F}_{m3} \\
 \bar{F}_{74} = -\bar{F}_{47} \\
 \bar{F}_{34} = m_2(\bar{a}_4 + \bar{\alpha}_4 \times \bar{G}_4) + \bar{\omega}_4 \times \bar{q}_4 - \bar{F}_{m2} - \bar{F}_{74} \\
 \bar{T}_2 = I_2\bar{\alpha}_4 + m_2(\bar{G}_4 \times \bar{a}_4) + \bar{\omega}_4 \times \bar{H}_4 + \bar{V}_4 \times \bar{q}_4 - \bar{G}_4 \times \bar{F}_{m2} - [l_2 \quad 0 \quad 0]^T \times \bar{F}_{74} \\
 \bar{F}_{43} = -\bar{F}_{34} \\
 \bar{F}_{03} = m_1(\bar{a}_3 + \bar{\alpha}_3 \times \bar{G}_3) + \bar{\omega}_3 \times \bar{q}_3 - \bar{F}_{43} - \bar{F}_{m1} \\
 \bar{T}_1 = I_1\alpha_3 + m_1(\bar{G}_3 \times a_3) + \bar{\omega}_3 \times \bar{H}_3 + \bar{V}_3 \times \bar{q}_3 - \bar{G}_3 \times \bar{F}_{m1} - [l_1 \quad 0 \quad 0]^T \times \bar{F}_{43} \\
 \bar{F}_{30} = -\bar{F}_{03}
 \end{array} \right.$$
