## A REDUCTION THEOREM FOR GOOD BASIC INVARIANTS OF FINITE COMPLEX REFLECTION GROUPS

YUKIKO KONISHI AND SATOSHI MINABE

Abstract. This is a sequel to our previous article [\[10\]](#page-29-0). We describe a certain reduction process of Satake's good basic invariants. We show that if the largest degree  $d_1$  of a finite complex reflection group G is regular and if  $\delta$  is a divisor of  $d_1$ , a set of good basic invariants of G induces that of the reflection subquotient  $G_{\delta}$ . We also show that the potential vector field of a duality group G, which gives the multiplication constants of the natural Saito structure on the orbit space, induces that of  $G_{\delta}$ . Several examples of this reduction process are also presented.

#### 1. INTRODUCTION

A reflection on a complex vector space  $V$  is a linear transformation of finite order which fixes a hyperplane pointwise. A finite subgroup  $G$  of  $GL(V)$  is called a finite complex reflection group if it is generated by reflections. It is well-known that such a group is characterized by the property that the ring of polynomial invariants is freely generated, i.e. it is generated by a set of algebraically independent homogeneous polynomials. Such a set of generators is called a set of basic invariants. The reader can find basic invariants in [\[16\]](#page-29-1) for finite Coxeter groups, [\[13,](#page-29-2) §2.8] for imprimitive groups  $G(m, p, n)$ , [\[23\]](#page-29-3)[\[13,](#page-29-2) §6.6] for primitive groups of rank two, [\[19,](#page-29-4) §B.3] and references therein for primitive groups of rank  $\geq 3$ .

As far as the authors know, there are two directions in pursuing distinguished sets of basic invariants. The one direction, which we do not deal with, is the so-called canonical system. See [\[6\]](#page-29-5), [\[7\]](#page-29-6), [\[17\]](#page-29-7), [\[18\]](#page-29-8), [\[25\]](#page-29-9). The other direction is the flat generator system proposed by Saito–Yano–Sekiguichi [\[20\]](#page-29-10) for finite Coxeter groups. It is nowadays understood as a flat coordinate system of the structure of a Frobenius manifold on the orbit space. See [\[21\]](#page-29-11), [\[3\]](#page-28-0). Generalizations of these results to finite complex reflection groups are obtained by several groups of authors [\[2\]](#page-28-1), [\[8\]](#page-29-12), [\[9\]](#page-29-13).

Recently, Satake [\[22\]](#page-29-14) introduced the notion of good basic invariants for finite complex reflection groups. For finite Coxeter groups, he showed that good basic invariants are flat in the sense of [\[20\]](#page-29-10). Moreover he found a formula for multiplication constants of the

<sup>2020</sup> Mathematics Subject Classification. Primary 53D45; Secondary 20F55.

Key words and phrases. Frobenius manifolds, Invariant theory, Coxeter groups, Complex reflection groups.

Frobenius manifold structure on the orbit spaces. In [\[10\]](#page-29-0), the authors showed that good basic invariants are flat coordinates of the natural Saito structures constructed in [\[9\]](#page-29-13) and gave a formula for the multiplication constants.

The aim of this paper is to describe a certain reduction process of Satake's good basic invariants regarding reflection subquotients of finite complex reflection groups. The theory of the reflection subquotients was developed by Lehrer and Springer [\[11\]](#page-29-15), [\[12\]](#page-29-16). Let G be a finite complex reflection group. If E is the  $\xi$ -eigenspace of a  $\xi$ -regular element of G, where  $\xi$  is a primitive  $\delta$ -th root of unity, then the subgroup  $N_E = \{s \in G \mid s(E) = E\}$ is a finite complex reflection group on E. It is called a  $\delta$ -reflection subquotient of G and denoted by  $G_{\delta}$ . See §[2](#page-2-0) for detail. In this article, we show that a set of good basic invariants induces that of the reflection subquotient  $G_{\delta}$  by a divisor  $\delta$  of the largest degree  $d_1$  of G (Theorem [3.1\)](#page-6-0). We also show that the potential vector field of a duality G, which gives the multiplication constants of the natural Saito structure [\[10\]](#page-29-0), induces that of  $G_{\delta}$ (Thoerem [3.3\)](#page-7-0). The key to our arguments is the notion of an admissible triplet introduced by Satake [\[22\]](#page-29-14). An admissible triplet  $(g, \zeta, q)$  consists of a  $d_1$ -th primitive root of unity  $\zeta$ , a  $\zeta$ -regular element g and a  $\zeta$ -regular eigenvector q of g. If a positive integer  $\delta$  is a divisor of  $d_1$  and E is the  $\zeta^{d_1/\delta}$ -eigenspace of  $g^{d_1/\delta}$ , the corresponding reflection subquotient  $G_\delta$ has the same largest degree  $d_1$  as G, and  $(g|_E, \zeta, q)$  is an admissible triplet of  $G_\delta$ . Hence there exists a sequence of reflection subquotients with the same  $d_1$ . For example, for imprimitive groups, we have

<span id="page-1-0"></span>(1.1) 
$$
G(m, m, n+1) \xrightarrow{m} G(m, 1, n) \xrightarrow{k} G\left(km, 1, \frac{n}{k}\right) \quad (d_1 = nm) .
$$

Here in the first arrow, it is assumed that  $n + 1$  is not divisible by m and in the second arrow, k is a divisor of n. As for primitive groups, we list two sequences in Figures [1](#page-2-1) and [2.](#page-2-2)

The article is organized as follows. We first recall the definitions of regular elements, reflection subquotients, admissible triplets and good basic invariants in §[2.](#page-2-0) In §[3,](#page-5-0) we prove the above results. The rest of the article is devoted to the examples depicted in [\(1.1\)](#page-1-0) and Figures [1](#page-2-1) and [2.](#page-2-2)

<span id="page-2-1"></span>FIGURE 1. The sequence of reflection subquotients of  $G_{35} = E_6$ . All those six groups are duality groups with  $d_1 = 12$ . The numbers written under each group are the degrees of that group.

<span id="page-2-2"></span>FIGURE 2. The sequence of reflection subquotients of  $G_{31}$ . Note that  $G_{31}$ is not a duality group while the other three groups are duality groups with  $d_1 = 24.$ 

# <span id="page-2-0"></span>2. Regular elements, reflection subquotients, admissible triplets and good basic invariants

2.1. Notations. In this section, G denotes a finite complex reflection group acting on a complex vector space V of dimension n. The degrees of G are denoted  $d_1, \ldots, d_n$  and the codegrees of G are denoted  $d_1^*, \ldots, d_n^*$ . Unless otherwise stated, we assume that the

degrees are in the descending order and the codegrees are in the ascending order:

$$
d_1 \geq d_2 \geq \ldots \geq d_n, \quad d_1^*(=0) \leq d_2^* \leq \ldots, \leq d_n^*
$$

.

We also assume that any set of basic invariants  $x_1, \dots, x_n$  is taken so that  $\deg x_\alpha = d_\alpha$ .

For a positive integer  $d$ , we set

$$
\mathfrak{a}(d) := \#\{\alpha \mid d \text{ divides } d_{\alpha}\}, \quad \mathfrak{b}(d) := \#\{\alpha \mid d \text{ divides } d_{\alpha}^*\}.
$$

We also put

$$
\mathfrak{i}(d) = \{ \alpha \in \{1, 2, ..., n\} \mid d \text{ divides } d_{\alpha} \}, \quad \mathfrak{i}^{c}(d) = \{1, 2, ..., n\} \setminus \mathfrak{i}(d).
$$

<span id="page-3-1"></span>For  $g \in GL(V)$  and  $\zeta \in \mathbb{C}$ ,  $V(g,\zeta)$  denotes the  $\zeta$ -eigenspace of g in V.

2.2. Regular elements. In this subsection, we recall the definitions of regular vector, regular element and the existence theorem for regular elements [\[24\]](#page-29-17) [\[13,](#page-29-2) Ch.11].

- **Definition 2.1.** (i) A vector  $q \in V$  is regular if it lies on no reflection hyperplanes of G.
	- (ii) An element  $g \in G$  is regular if g has an eigenspace  $V(g,\zeta)$  which contains a regular vector. In this case, we say that g is a  $\zeta$ -regular element. If  $\zeta$  is a primitive d-th root of unity, then we also say that  $q$  is a  $d$ -regular element.
- **Remark 2.2.** (1) It is known that the necessary and sufficient condition for the existence of a *d*-regular element of G is  $a(d) = b(d)$ . See [\[13,](#page-29-2) Theorem 11.28].
	- (2) Eigenvalues of a  $\zeta$ -regular element g are  $\zeta^{1-d_\alpha}$   $(1 \le \alpha \le n)$ . In particular,  $\zeta^{d_\alpha} = 1$ for some  $\alpha$  [\[13,](#page-29-2) Theorem 11.56].

2.3. Reflection subquotients in the regular cases. We collect necessary facts on reflection subquotient.

For a subspace  $E \subset V$ , we put

$$
(2.1) \qquad N_E = \{ s \in G \mid s(E) \subset E \}, \quad C_E = \{ s \in G \mid s(v) = v \text{ for all } v \in E \}.
$$

The map from  $N_E$  to  $GL(E)$  obtained by restricting the action of each element  $s \in N_E$ to E is denoted  $\pi_E$ . The surjective homomorphism  $S[V] \to S[E]$  of polynomial rings induced by the inclusion  $E \to V$  is denoted  $\phi_E$ .

<span id="page-3-0"></span>The following results can be found in [\[13,](#page-29-2) Lemma 11.14, Corollary 11.17, Theorem 11.24, Theorem 11.33, Theorem 11.38, Theorem 11.39].

**Proposition 2.3.** Let G be a finite complex reflection group. Let  $\delta$  be a regular number for G, i.e. a positive integer satisfying  $a(\delta) = b(\delta)$ . Let  $h \in G$  be a  $\xi$ -regular element with respect to a δ-th primitive root of unity  $\xi$  and let  $E = V(h,\xi)$ . Then the followings hold.

- (1) dim  $E = \mathfrak{a}(\delta)$ .
- (2)  $N_E = \{ s \in G \mid sh = hs \}.$
- (3)  $C_E = \{1\}$ . Thus  $\pi_E(N_E)$  acts faithfully on E.
- (4)  $\pi_E(N_E)$  is a finite complex reflection group on E. Its reflection hyperplanes are the intersections with  $E$  of the reflection hyperplanes of  $G$  not containing  $E$ .
- (5) If  $x = (x_1, \ldots, x_n)$  is a set of basic invariants of G, then  $\phi_E(x_\alpha) = 0$  for  $\alpha \in$  $\mathfrak{i}^c(\delta)$ . Moreover  $\phi_E(x_\alpha)$   $(\alpha \in \mathfrak{i}(\delta))$  form a set of basic invariants of  $\pi_E(N_E)$ . In particular, the degrees of  $\pi_E(N_E)$  are  $d_\alpha$   $(\alpha \in \mathfrak{i}(\delta)).$
- (6) If G is an irreducible finite complex reflection group, so is  $\pi_E(N_E)$ .
- (7) The codegrees of  $\pi_E(N_E)$  are those of G which are divisible by  $\delta$ .

**Remark 2.4.** It is known that the triviality of  $C_E$  is equivalent to the regularity of E ([\[13,](#page-29-2) Lemma 11.22]). Even if  $E = V(h,\xi)$  is not regular, it is known that if  $E = V(h,\xi)$ is a maximal  $\xi$ -subspace then  $\pi_E(N_E) \cong N_E/C_E$  is a complex reflection group on E. See [\[13,](#page-29-2) Ch 11] and the references therein. By this reason, the reflection group  $\pi_E(N_E)$ in Proposition [2.3](#page-3-0) is called a reflection subquotient, although we only treat the cases of regular  $E$  in the rest of the article.

If both  $\xi, \tilde{\xi}$  are  $\delta$ -th primitive roots of unity, the reflection subquotients by a  $\xi$ -regular element h and that by a  $\tilde{\xi}$ -regular element  $\tilde{h}$  are conjugate [\[13,](#page-29-2) Proposition 11.18]. So the reflection subquotient  $\pi_E(N_E)$  is uniquely determined up to conjugacy by the regular number  $\delta$ . It is denoted  $G_{\delta}$  and called the  $\delta$ -reflection subquotient in this article.

2.4. Admissible triplet and good basic invariants. In this subsection, we recall the definitions of admissible triplets and good basic invariants introduced by Satake [\[22\]](#page-29-14).

**Definition 2.5.** A triple  $(g, \zeta, q)$  consisting of

- a primitive  $d_1$ -th root of unity  $\zeta$  (where  $d_1$  is the largest degree of  $G$ ),
- a  $\zeta$ -regular element  $q \in G$ ,
- a regular vector q satisfying  $qq = \zeta q$ ,

is called an admissible triplet of G.

As stated in §[2.2,](#page-3-1) the necessary and sufficient condition for the existence of an admissible triplet is  $a(d_1) = b(d_1)$ .

**Definition 2.6.** Let  $(g, \zeta, q)$  be an admissible triplet of G. We say that a linear coordinate system  $z = (z_1, \ldots, z_n)$  of V is a  $(g, \zeta)$ -graded coordinate system if

$$
g^* z_\alpha = \zeta^{d_\alpha - 1} z_\alpha \quad (1 \le \alpha \le n)
$$

holds.

Given a  $\zeta$ -regular element g, the eigenspace decomposition gives a basis of V consisting of eigenvectors of q. If one takes the associated coordinate system, it is  $(q, \zeta)$ -graded.

**Definition 2.7.** Let  $(g, \zeta, q)$  be an admissible triplet of G and let  $z = (z_1, \ldots, z_n)$  be a  $(g, \zeta)$ -graded coordinate system. We say that a set of basic invariants  $x = (x_1, \ldots, x_n)$  is compatible at q with z if

(2.2) 
$$
\frac{\partial x_{\alpha}}{\partial z_{\beta}}(q) = \begin{cases} 1 & (\alpha = \beta) \\ 0 & (\alpha \neq \beta) \end{cases} \quad (1 \leq \alpha, \beta \leq n).
$$

For any admissible triplet  $(g, \zeta, q)$  and any  $(g, \zeta)$ -graded coordinate system z, there exists a set of basic invariants which is compatible with  $z$  at  $q$ .

For  $1 \leq \alpha \leq n$ , we set

$$
(2.3) \tI_{\alpha}^{(0)} = \{(a_1, \ldots, a_n) \in \mathbb{Z}_{\geq 0}^n \mid a_1 d_1 + \cdots + a_n d_n = d_{\alpha}, a_1 + \cdots + a_n \geq 2\}.
$$

**Definition 2.8.** A set of basic invariants  $x = (x_1, \ldots, x_n)$  of G is good with respect to an admissible triplet  $(g, \zeta, q)$  if

(2.4) 
$$
\frac{\partial^{a_1+\cdots+a_n} x_\alpha}{\partial z_1^{a_1}\cdots \partial z_n^{a_n}}(q) = 0 \quad (1 \le \alpha \le n, (a_1,\ldots,a_n) \in I_\alpha^{(0)}),
$$

where  $z = (z_1, \ldots, z_n)$  is a  $(g, \zeta)$ -graded coordinate system of V.

Remark 2.9. The definition of good basic invariants does not depend on the choice of the graded coordinate system in the sense that any two sets of good basic invariants with respect to the same admissible triplet are C-linear combinations of each other [\[22,](#page-29-14) [10\]](#page-29-0). Moreover, if  $a(d_1) = b(d_1) = 1$ , the set of good basic invariants does not depend on the choice of admissible triplet in the sense that any two sets of good basic invariants with respect to (possibly different) admissible triplets are C-linear combinations of each other.

### 3. Reduction Theorem

<span id="page-5-1"></span><span id="page-5-0"></span>3.1. Admissible triplet and reflection subquotients. In this section,  $G$  is a finite complex reflection group satisfying  $a(d_1) = b(d_1)$  and  $(g, \zeta, q)$  is an admissible triplet of G. Let  $\delta > 1$  be a divisor of  $d_1$ . Then  $\zeta^{d_1/\delta}$  is a primitive  $\delta$ -th root of unity, and  $g^{d_1/\delta}$ is  $\zeta^{d_1/\delta}$ -regular. So we can apply Proposition [2.3](#page-3-0) to this setting. Let  $E = V(g^{d_1/\delta}, \zeta^{d_1/\delta})$ and let  $N_E$ ,  $\pi_E$ ,  $\phi_E$  be as defined in Proposition [2.3.](#page-3-0)

Then next statements easily follow from Proposition [2.3.](#page-3-0)

- $G_{\delta} := \pi_E(N_E)$  is a reflection group on E.
- The highest degree of  $G_{\delta}$  is  $d_1$ .
- $q \in E$  since  $gq = \zeta q$  implies  $g^{d_1/\delta} q = \zeta^{d_1/\delta} q$ .
- $g \in N_E$  since g commutes with  $g^{d_1/\delta}$ .

<span id="page-6-0"></span>•  $(\pi_E(g), \zeta, q)$  is an admissible triplet of  $G_\delta$ .

#### 3.2. Good basic invariants of  $G_{\delta}$ .

**Theorem 3.1.** (1) If  $z = (z^1, \ldots, z^n)$  is a  $(g, \zeta)$ -graded coordinate system of V,  $\phi_E(z_\alpha) = 0 \ (\alpha \in \mathfrak{i}^c(\delta)) \ \text{on } E.$  Moreover  $\phi_E(z_\alpha) \ (\alpha \in \mathfrak{i}(\delta)) \ \text{form a } (\pi_E(g), \zeta)$ -graded coordinate system of E. In other words, the ring homomorphism  $\phi_E : S[V] \to S[E]$ is given by

(3.1) 
$$
S[V] \cong \mathbb{C}[z_1,\ldots,z_n] \longrightarrow S[E] \cong \mathbb{C}[z_1,\ldots,z_n]/(z_\alpha \mid \alpha \in \mathfrak{i}^c(\delta)) .
$$

- <span id="page-6-2"></span>(2) If a set  $x = (x_1, \ldots, x_n)$  of basic invariants of G is compatible at q with a  $(g, \zeta)$ graded coordinate system z of V, then the set of basic invariants  $\phi_E(x_\alpha)$   $(\alpha \in \mathfrak{i}(\delta))$ of  $G_{\delta}$  is compatible at q with  $\phi_E(z_{\alpha})$   $(\alpha \in \mathfrak{i}(\delta)).$
- (3) If a set  $x = (x^1, \ldots, x^n)$  of basic invariants of G is good with respect to  $(g, \zeta, q)$ , then the set of basic invariants  $\phi_E(z_\alpha)$   $(\alpha \in \mathfrak{i}(\delta))$  of  $G_\delta$  is good with respect to  $(\pi_E(g), \zeta, q).$

*Proof.* (1) The basis associated to the  $(g, \zeta)$ -graded coordinate system z consists of eigenvectors  $q_1, \ldots, q_n$  of g satisfying  $g q_\alpha = \zeta^{1-d_\alpha} q_\alpha$ . Then  $q_\alpha \in E$  if and only if  $\zeta^{(1-d_\alpha)d_1/\delta} =$  $\zeta^{d_1/\delta}$ , or  $\zeta^{d_1 d_\alpha/\delta} = 1$ . This condition is equivalent to the condition that  $d_\alpha$  is divisible by δ. Therefore

<span id="page-6-1"></span>(3.2) 
$$
E = \bigoplus_{\alpha \in i(\delta)} \mathbb{C}q_{\alpha} .
$$

This implies that  $\pi_E(z_\alpha)$   $(\alpha \in \mathfrak{i}(\delta))$  make a coordinate system of E and that the coordinate system is  $(\pi_E(g), \zeta)$ -graded. Eq.[\(3.2\)](#page-6-1) also implies that  $z_\alpha = 0$  on E for  $\alpha \in \mathfrak{i}^c(\delta)$ . So the subspace E is the zero set of  $z_{\alpha}$   $(\alpha \in \mathfrak{i}^c(\delta))$  and  $(3.1)$  follows.

In the proofs of (2)(3), we identify  $\phi_E(z_\alpha)$  ( $\alpha \in \mathfrak{i}(\delta)$ ) with  $z_\alpha$  to simplify the notation. (2) First recall from Theorem [2.3](#page-3-0) that  $\phi_E(x_\alpha)$   $(\alpha \in \mathfrak{i}(\delta))$  is a set of basic invariants of  $G_\delta$ .

Notice that for  $f \in S[V]$  and  $\alpha \in \mathfrak{i}(\delta)$ ,

(3.3) 
$$
f(q) = \phi_E(f)(q), \quad \phi_E\left(\frac{\partial f}{\partial z_\alpha}\right) = \frac{\partial \phi_E(f)}{\partial z_\alpha}
$$

hold. Therefore

<span id="page-6-3"></span>
$$
\frac{\partial \phi_E(x_\beta)}{\partial z_\alpha}(q) = \frac{\partial x_\beta}{\partial z_\alpha}(q) = \begin{cases} 1 & (\alpha = \beta) \\ 0 & (\alpha \neq \beta) \end{cases} \qquad (\alpha, \beta \in \mathfrak{i}(\delta))
$$

holds by the compatibility of x with  $z$ .

(3) Let us set

$$
I_{\alpha}^{(0)}(\delta) = \{ (a_1, \dots a_n) \in I_{\alpha}^{(0)} \mid a_{\mu} = 0 \text{ for all } \mu \in \mathfrak{i}^c(\delta) \} \quad (1 \le \alpha \le n) .
$$

For  $\beta \in \mathfrak{i}(\delta)$  and  $(a_1, \ldots, a_n) \in I_\alpha^{(0)}(\delta)$ ,

$$
\frac{\partial^{a_1+\dots+a_n} \phi_E(x_\beta)}{\partial z_1^{a_1}\cdots \partial z_n^{a_n}}(q) = \frac{\partial^{a_1+\dots+a_n} x^\beta}{\partial z_1^{a_1}\cdots \partial z_n^{a_n}}(q)
$$

holds because of  $(3.3)$ . Given that x is good, it is immediate to see that the right-hand-side vanishes.  $\Box$ 

3.3. Potential vector field of  $G_{\delta}$ . A duality group is an irreducible finite complex reflection group satisfying the relation [\[19,](#page-29-4) §B4] [\[13,](#page-29-2) §12.6]

(3.4) 
$$
d_{\alpha} + d_{\alpha}^* = d_1 \quad (1 \le \alpha \le n).
$$

It is known that  $a(d_1) = b(d_1) = 1$  holds for all duality groups.

<span id="page-7-1"></span>In this subsection, first we recall the potential vector field of the natural Saito structure for duality groups [\[9,](#page-29-13) §7.5].

**Definition 3.2.** Let  $(g, \zeta, q)$  and  $z = (z_1, \ldots, z_n)$  be an admissible triplet of a duality group G acting on V and a  $(g,\zeta)$ -graded coordinate system of V. Let  $x = (x_1,\ldots,x_n)$ be a set of good basic invariants with respect to  $(g,\zeta,q)$ . It is also assumed that x is compatible with z at q. The potential vector field of G is an n-tuple  $(\mathcal{G}_1, \ldots, \mathcal{G}_n)$  of the G-invariant polynomials

$$
(3.5) \qquad \mathcal{G}_{\gamma} = \frac{z_1(q)}{d_{\gamma} - 1} \sum_{(a_1, ..., a_n) \in I_{\gamma}^{(1)}} \frac{\partial^{a_1 + \dots + a_n} x_{\gamma}}{\partial z_1^{a_1} \cdots \partial z_n^{a_n}} (q) \cdot \frac{x_1^{a_1} \cdots x_n^{a_n}}{a_1! \cdots a_n!} \quad (1 \le \gamma \le n) .
$$

Here

$$
I_{\gamma}^{(1)} = \{ (a_1, \ldots, a_n) \in \mathbb{Z}_{\geq 0}^n \mid a_1 d_1 + \cdots + a_n d_n = d_{\gamma} + d_1, a_1 + \cdots + a_n \geq 2 \}.
$$

<span id="page-7-0"></span>Let G be a duality group and  $\delta > 1$  be a divisor of  $d_1$ . Then notice that the reflection subquotient  $G_{\delta}$  is also a duality group.

**Theorem 3.3.** Using the notations of  $\S3.1$  $\S3.1$  and Definition [3.2,](#page-7-1) we have the followings.

- (1)  $\phi_E(\mathcal{G}^\gamma) = 0 \text{ for } \gamma \in \mathfrak{i}^c(\delta).$
- (2)  $\phi_E(\mathcal{G}^{\gamma})$  ( $\alpha \in \mathfrak{i}(\delta)$ ) form a potential vector field of  $G_{\delta}$ .

Proof. (1) Let us set

$$
I_{\gamma}^{(1)}(\delta) = \{ (a_1, \dots, a_n) \in I_{\gamma}^{(1)} \mid a_{\mu} = 0 \text{ for all } \mu \in \mathfrak{i}^c(\delta) \} \quad (1 \le \gamma \le n) .
$$

Because of the vanishing  $\phi_E(x_\alpha) = 0$   $(\alpha \in \mathfrak{i}^c(\delta))$ , we have

$$
\phi_E(\mathcal{G}^{\gamma}) = \frac{z^1(q)}{d_{\gamma}-1} \sum_{(a_1,\ldots,a_n)\in I_{\gamma}^{(1)}(\delta)} \frac{\partial^{a_1+\cdots+a_n} x_{\gamma}}{\partial z_1^{a_1}\cdots \partial z_n^{a_n}}(q) \cdot \frac{\phi_E(x_1^{a_1}\cdots x_n^{a_n})}{a_1!\cdots a_n!}
$$

Moreover, in the right-hand-side,

$$
\frac{\partial^{a_1+\cdots+a_n} x^{\gamma}}{\partial z_1^{a_1}\cdots \partial z_n^{a_n}}(q) \stackrel{(3.3)}{=} \frac{\partial^{a_1+\cdots+a_n} \phi_E(x^{\gamma})}{\partial z_1^{a_1}\cdots \partial z_n^{a_n}}(q).
$$

Thus we obtain the expression

<span id="page-8-0"></span>(3.6) 
$$
\phi_E(\mathcal{G}^{\gamma}) = \frac{z^1(q)}{d_{\gamma}-1} \sum_{(a_1,\dots,a_n)\in I_{\gamma}^{(1)}(\delta)} \frac{\partial^{a_1+\dots+a_n}\phi_E(x_{\gamma})}{\partial z_1^{a_1}\cdots \partial z_n^{a_n}}(q) \cdot \frac{\phi_E(x_1^{a_1}\cdots x_n^{a_n})}{a_1!\cdots a_n!}
$$

<span id="page-8-2"></span>For  $\gamma \in \mathfrak{i}^c(\delta)$ , we have  $\phi_E(x^{\gamma}) = 0$  and hence  $\phi_E(\mathcal{G}^{\gamma}) = 0$ . For  $\gamma \in \mathfrak{i}(\delta)$ , [\(3.6\)](#page-8-0) is nothing but the potential vector field of  $G_{\delta}$ .

Remark 3.4. Under the change of basic invariants, the vector field

$$
x_{1}^{-1}\sum_{\gamma=1}^{n}\mathcal{G}_{\gamma}\frac{\partial}{\partial x_{\gamma}}
$$

is invariant. The factor  $x_1^{-1}$  comes from the factor  $\Omega_1^{-1}$  in the definition of  $C_{\alpha\beta}^{\gamma}$  of [\[9,](#page-29-13) Lemma 7.4].

### 4. REFLECTION SUBQUOTIENTS OF  $G(m, m, n+1)$  AND  $G(m, 1, n)$

In this section, we first recall admissible triplets for  $G(m, m, m+1)$  and  $G(m, 1, n)$  used in [\[10,](#page-29-0) §10]. Then we consider reflection subquotients of the duality groups  $G(m, m, n+1)$ and  $G(m, 1, n)$ . For the definitions of the groups  $G(m, m, n + 1)$ ,  $G(m, 1, n)$  and their degrees, basic invariants and so on, see [\[13,](#page-29-2) §2].

The cyclic group consisting of m-th roots of unity is denoted  $\mu_m$ . The standard basis of  $\mathbb{C}^n$  is denoted  $\{e_1, \ldots, e_n\}$  and the associated linear coordinates are denoted  $u_1, \ldots, u_n$ . In this section,  $\zeta$  is a primitive *nm*-th root of unity.

<span id="page-8-1"></span>4.1.  $G(m, m, n+1)$  for  $m \ge 2, n \ge 1$ . Let

$$
\mathcal{A}(m, m, n+1) = \{(\theta_1, \dots, \theta_{n+1}, \sigma) \in \mu_m^{n+1} \times \mathfrak{S}_{n+1} \mid \theta_1 \cdots \theta_{n+1} = 1\}.
$$

As a set, the group  $G(m, m, n+1)$  is  $\mathcal{A}(m, m, n+1)$ . Its group structure as well as the action on  $\mathbb{C}^{n+1}$  is given by the following injection  $\iota_{n+1} : \mathcal{A}(m, m, n+1) \to GL_{n+1}(\mathbb{C})$ :

$$
\iota_{n+1}(\theta_1,\ldots,\theta_{n+1},\sigma)e_i=\theta_{\sigma(i)}e_{\sigma(i)}
$$

.

For example, if  $n = 2$  and if  $\sigma$  is the cyclic permutation  $(3\ 2\ 1)$ ,

$$
\iota_{n+1}(\theta_1, \theta_2, \theta_3, \sigma) = \begin{bmatrix} 0 & \theta_1 & 0 \\ 0 & 0 & \theta_2 \\ \theta_3 & 0 & 0 \end{bmatrix}.
$$

.

 $G(m, m, n + 1)$  is a duality group of rank  $n + 1$  and the degrees are  $m, 2m, \ldots$  nm and  $n + 1$ . For convenience, we arrange the degrees in the following manner:

(4.1) 
$$
d_1 = nm, d_2 = (n-1)m, ..., d_{n-1} = 2m, d_n = m, d_{n+1} = n+1
$$
.

Let

$$
g := \iota_{n+1}(\underbrace{1,\ldots,1}_{n-1},\zeta^n,\zeta^{-n},(n,\cdots,2,1)) = \left[\begin{array}{cc|c} 0 & I_{n-1} & 0 \\ \zeta^n & 0 & 0 \\ \hline 0 & \zeta^{-n} \end{array}\right].
$$

Its eigenvalues are  $\lambda_i = \zeta^{1+(i-1)m}$   $(i = 1, \ldots, n)$  and  $\zeta^{-n}$ , and eigenvectors are

$$
q_i = \frac{1}{\sqrt{n}} \begin{bmatrix} 1 \\ \lambda_i \\ \lambda_i^2 \\ \vdots \\ \lambda_i^{n-1} \\ 0 \end{bmatrix} \quad (1 \le i \le n), \qquad q_{n+1} = \begin{bmatrix} 0 \\ \vdots \\ 0 \\ 1 \end{bmatrix}
$$

.

Since reflection hyperplanes of  $G(m, m, n + 1)$  are the orthogonal complements of

$$
e_i - \zeta^{kn} e_j
$$
  $(1 \le i < j \le n+1, 0 \le k < m)$ ,

it is not difficult to see that the vector  $q_1$  does not lie on any reflection hyperplanes. Therefore  $(g, \zeta, q_1)$  is an admissible triplet of  $G(m, m, n+1)$ .

It is known that a set of basic invariants of  $G(m, m, n + 1)$  is given by

$$
\sigma_{\alpha} := \begin{cases} \mathbb{E}_{n+1-\alpha}(u_1^m, \dots, u_{n+1}^m) & (1 \le \alpha \le n), \\ \mathbb{E}_{n+1}(u_1, \dots, u_{n+1}) = u_1 \cdots u_{n+1} & (\alpha = n+1). \end{cases}
$$

Here  $\mathbb{E}_k(v_1,\ldots,v_{n+1})$  denotes the k-th elementary symmetric polynomial in the  $(n+1)$ variables  $v_1, \ldots, v_{n+1}$ . It seems it is not feasible to obtain closed expressions of the good basic invariants and the potential vector field for general n. For  $G(m, m, 2)$ ,  $G(m, m, 3)$ and  $G(m, m, 4)$ , see [\[10,](#page-29-0) §10.1].

<span id="page-9-0"></span>4.2.  $G(m,1,n)$  for  $m\geq 2$ . As a set, the group  $G(m,1,n)$  is  $\mu_m^n\times\mathfrak{S}_n$ . Its group structure and the action on  $\mathbb{C}^n$  is given by the following injection  $\iota_n: G(m, 1, n) \to GL_n(\mathbb{C})$ :

$$
\iota_n(\theta_1,\ldots,\theta_n,\sigma)e_i=\theta_{\sigma(i)}e_{\sigma(i)}.
$$

 $G(m, 1, n)$  is a duality group of rank n and the degrees are  $m, 2m, \ldots, nm$ . As in the case of  $G(m, m, n+1)$ , we arrange the degrees in the following manner:

$$
d_1 = nm, d_2 = (n-1)m, ..., d_{n-1} = 2m, d_n = m.
$$

Let

$$
\bar{g} := \iota_n(\underbrace{1,\ldots,1}_{n-1},\zeta^n,(n\ \ldots\ 2\ 1)) = \left[\begin{array}{c|c} 0 & I_{n-1} \\ \hline \zeta^n & 0 \end{array}\right].
$$

Its eigenvalues are  $\lambda_i = \zeta^{1+(i-1)m}$   $(i = 1, \ldots, n)$  and  $\lambda_i$ -eigenvectors are

$$
\bar{q}_i = \frac{1}{\sqrt{n}} \begin{bmatrix} 1 \\ \lambda_i \\ \lambda_i^2 \\ \vdots \\ \lambda_i^{n-1} \end{bmatrix}.
$$

Since reflection hyperplanes of  $G(m, 1, n)$  are orthogonal complements of

$$
e_i - \zeta^{kn} e_j \ (1 \leq i < j \leq n, 0 \leq k < m), \quad e_i \ (1 \leq i \leq n),
$$

 $\bar{q}_1$  does not lie on any of these. Therefore  $\bar{q}_1$  is a regular vector and  $(\bar{g}, \zeta, \bar{q}_1)$  is an admissible triplet of  $G(m, 1, n)$ .

Let

$$
\bar{\sigma}_{\alpha} := \mathbb{E}_{n+1-\alpha}(u_1^m, \dots, u_n^m) \quad (\alpha = 1, \dots, n).
$$

Then  $\bar{\sigma}_1, \ldots, \bar{\sigma}_n$  form a set of basic invariants of  $G(m, 1, n)$ . For the good basic invariants and the potential vector field of  $G(m, 1, 2), G(m, 1, 3), G(m, 1, 4)$ , see [\[10,](#page-29-0) §10.2].

<span id="page-10-0"></span>4.3. The reflection subquotient of  $G(m, m, n+1)$  by  $\delta = m$ .

**Proposition 4.1.** If  $n+1$  is not divisible by m, the m-reflection subquotient of  $G(m, m, n+1)$ 1) is  $G(m, 1, n)$ .

*Proof.* Take the admissible triplet  $(g, \zeta, q_1)$  constructed in §[4.1.](#page-8-1) Notice that  $d_1/m = n$ . Since

$$
g^n = \begin{bmatrix} \zeta^n I_n & 0 \\ 0 & \zeta^{-n^2} \end{bmatrix},
$$

the  $\zeta^n$ -eigenspace E of  $g^n$  is

$$
E = \sum_{j=1}^{n} \mathbb{C}e_j .
$$

(Notice that we need the assumption here; if  $n+1$  is divisible by  $m, E = \mathbb{C}^{n+1}$ .) So the subgroup  $N_E = \{s \in G(m, m, n+1) \mid s(E) = E\}$  consists of matrices  $\iota_{n+1}(\theta_1, \ldots, \theta_n, \theta_{n+1}, \sigma)$ such that  $\sigma(n+1) = n+1$ . Then we immediately see that the *m*-reflection subquotient of  $G(m, m, n + 1)$  is  $G(m, 1, n)$ .

**Remark 4.2.** In the case where  $n+1$  is divisible by m, the  $\zeta^n$ -eigenspace of  $g^n$  is  $\mathbb{C}^{n+1}$  and the m-reflection subquotient of  $G(m, m, n+1)$  is itself. However, if we take  $E = \sum_{j=1}^{n} \mathbb{C}e_j$ instead of the  $\zeta^n$ -eigenspace of  $g^n$ ,  $N_E = G(m, 1, n)$  hold. Moreover the statements of Proposition [2.3\(](#page-3-0)5) and Theorems [3.1,](#page-6-0)[3.3](#page-7-0) hold true if we replace  $i(\delta)$  with  $\{1, 2, \ldots, n\}$  and  $\mathfrak{i}^c(\delta)$  with  $\{n+1\}.$ 

Proposition [4.1](#page-10-0) and Theorems [3.1](#page-6-0) and [3.3](#page-7-0) imply that one can obtain the good basic invariants and the potential vector field of  $G(m, 1, n)$  from those of  $G(m, m, n + 1)$ . As an example, the reader can compare those of  $G(m, m, 3)$  and  $G(m, 1, 2)$  listed in [\[10,](#page-29-0) §10.1, §10,2. Moreover, the following lift of good basic invariants from  $G(m,1,n)$  to  $G(m, m, n+1)$  holds.

**Proposition 4.3.** Let  $\bar{x} = (\bar{x}_1, \ldots, \bar{x}_n)$  be the set of good basic invariants of  $G(m, 1, n)$ with respect to  $(\bar{g}, \zeta, \bar{q}_1)$  which is compatible with the graded coordinates  $\bar{z}_1, \ldots, \bar{z}_n$ . If  $\bar{x}_{\alpha}$  $(1 \leq \alpha \leq n)$  is expressed as

$$
\bar{x}_{\alpha} = \sum_{\substack{a=(a_1,\ldots,a_n)\in\mathbb{Z}_{\geq 0}^n:\\a_1d_1+\cdots+a_nd_n=d_{\alpha}}} c_a^{\alpha} \cdot \bar{\sigma}_1^{a_1} \cdots \bar{\sigma}_n^{a_n} \quad (c_a^{\alpha} \in \mathbb{C}),
$$

then

(4.2) 
$$
x_{\alpha} = \sum_{\substack{a=(a_1,\ldots,a_n)\in\mathbb{Z}_{\geq 0}^n;\\a_1d_1+\cdots+a_nd_n=d_{\alpha}}} c_{a}^{\alpha} \cdot \sigma_1^{a_1} \cdots \sigma_n^{a_n},
$$

$$
x_{n+1} = (\sqrt{n})^n \zeta_{nm}^{-\frac{n(n+1)}{2}} \sigma_{n+1}
$$

form a set of good basic invariants of  $G(m, m, n + 1)$  with respect to  $(g, \zeta, q_1)$  which is compatible with the graded coordinates  $\bar{z}_1, \ldots, \bar{z}_n, u_{n+1}.$ 

The proof is elementary and omitted.

4.4. Reflection subquotients of  $G(m, 1, n)$ . Since all the degrees of  $G(m, 1, n)$  are divisible by m, considering the reflection subquotients by divisors of  $d_1 = nm$  is the same as considering those by m times divisors of n. So let  $k > 1$  be a divisor of n.

**Proposition 4.4.** The km-reflection subquotient of  $G(m,1,n)$  is isomorphic to  $G(km,1,\frac{n}{k})$  $\frac{n}{k}$ .

*Proof.* Take the admissible triplet  $(\bar{g}, \zeta, \bar{q}_1)$  constructed in §[4.2.](#page-9-0) Notice that  $d_1/(km)$  =  $n/k=:n'.$ 

First we study the  $\zeta^{n'}$ -eigenspace E of  $\bar{g}^{n'}$ . The eigenvectors  $\bar{q}_{\alpha}$   $(1 \leq \alpha \leq n)$  of  $\bar{g}$ given in §[4.2](#page-9-0) has eigenvalue  $\zeta^{1+(\alpha-1)m}$ . Therefore  $\bar{q}_\alpha \in E$  is equivalent to  $(\alpha-1)n'm \equiv 0$ mod *nm*, or  $\alpha - 1 \equiv 0 \mod k$ . So we have

$$
E = \bigoplus_{\beta=0}^{n'-1} \mathbb{C}\bar{q}_{1+k\beta} .
$$

Notice that  $\bar{q}_{1+k\beta}$  is written as follows.

$$
\bar{q}_{1+k\beta} = \frac{1}{\sqrt{n}} \sum_{i=0}^{n-1} (\zeta^{1+km\beta})^i e_{i+1} \stackrel{i=j+pn'}{=} \frac{1}{\sqrt{n}} \sum_{j=0}^{n'-1} \zeta^{(1+km\beta)j} \sum_{p=0}^{k-1} \zeta^{pn'} e_{j+pn'+1} .
$$

Therefore if we put

$$
\check{e}_j = \frac{1}{\sqrt{k}} \sum_{p=0}^{k-1} \zeta^{pn'} e_{j+pn'} \quad (1 \le j \le n'),
$$

we have

$$
\bar{q}_{1+k\beta} = \frac{\sqrt{k}}{\sqrt{n}} \sum_{j=1}^{n'} \zeta^{(1+km\beta)(j-1)} \tilde{e}_j .
$$

Thus we have

$$
E = \bigoplus_{j=1}^{n'} \mathbb{C}\check{e}_j .
$$

Next we study the subgroup  $N_E = \{s \in G(m, 1, n) \mid s(E) = E\}$ . Let  $\kappa : GL_{n'}(\mathbb{C}) \to$  $GL_n(\mathbb{C})$  be the following injection;

$$
\kappa(X) = \begin{bmatrix} X & O \\ \cdot & \cdot \\ O & X \end{bmatrix} \, .
$$

If  $X = \iota_{n'}(\theta_1, \ldots, \theta_{n'}, \sigma)$ , then

$$
\kappa(X)e_{j+pn'} = \theta_{\sigma(j)}e_{\sigma(j)+pn'} \quad (1 \le j \le n', 0 \le p < k)
$$

and

$$
\kappa(X)\check{e}_j = \frac{1}{\sqrt{k}} \sum_{p=0}^{k-1} \zeta^{pn'} \theta_{\sigma(j)} e_{\sigma(j)+pn'} = \theta_{\sigma(j)} \check{e}_{\sigma(j)}.
$$

Therefore  $\kappa(X)$  preserves the subspace E. In other words,  $\kappa(G(m, 1, n)) \subset N_E$ .

On the other hand, by Proposition [2.3-](#page-3-0)(4), the degrees of the km-reflection subquotient  $G(m, 1, n)_{km}$  are  $km, 2km, \ldots, n'km$ . Since the order of the reflection group equals the product of its degrees,

$$
|G(m,1,n)_{km}| = (km) \cdot (2km) \cdots (n'km) = |G(km,1,n')|.
$$

Thus  $G(m, 1, n)_{km} \cong G(km, 1, n').$ 

As an example, the reader can check that the set of good basic invariants of  $G(m, 1, 4)$ [\[10,](#page-29-0) §10.2.3] induce that of  $G(2m, 1, 2)$  [\[10,](#page-29-0) §10.2.1]: If we set

$$
\bar{\sigma}_1 \to \bar{\sigma}_1, \ \bar{\sigma}_2 \to 0, \ \bar{\sigma}_3 \to \bar{\sigma}_2, \ \bar{\sigma}_4 \to 0,
$$

in  $x_1, x_3$  of  $G(m, 1, 4), x_1, x_3$  are mapped to  $x_1, x_2$  of  $G(2m, 1, 2)$ .

 $\Box$ 

- 4.5. The reduction sequence of  $G(m, m, n + 1)$ . Let  $\delta$  be a divisor of  $d_1 = nm$ .
	- If  $\delta$  is a divisor of both m and  $n+1$ , the  $\delta$ -reflection subquotient is  $G(m, m, n+1)$ itself.
	- If  $\delta$  is a divisor of m and if  $n+1$  is not divisible by  $\delta$ , then by construction, the δ-reflection subquotient is the same as the m-reflection subquotient  $G(m, 1, n)$ .
	- Since  $\delta > 1$  is assumed to be a divisor of  $d_1 = nm$ , it cannot happen that  $\delta$  is not a divisor of m but that  $\delta$  is a divisor of  $n+1$ .
	- If both m and  $n + 1$  are not divisible by  $\delta$ , let us write  $\delta = k \cdot m'$  where m' is the greatest common divisor of  $\delta$  and m. Notice that  $k > 1$  must be a divisor of *n*, since  $\delta$  is a divisor of *nm*. For such  $\delta$ , the *km'*-reflection subquotient is the compotision of the m'-reflection subquotient which is  $G(m, 1, n)$  and the kreflection subquotient. This process is described in [\(1.1\)](#page-1-0).

# 5. SEQUENCE OF REFLECTION SUBQUOITENTS OF  $G_{35} = E_6$

In this section and the next, we study the sequences of reflection subquotients depicted in Figures [1,](#page-2-1)[2](#page-2-2) respectively. To avoid double subscripts such as  $(G_{\bullet})_{\delta}$ , we write  $G_{\bullet}(\delta)$  for the  $\delta$ -reflection subquotient of a primitive group  $G_{\bullet}$ . For each group, we construct an admissible triplet, a set of good basic invariants and the potential vector field. For each arrow

$$
G_{\bullet} \stackrel{\delta}{\longrightarrow} G_{\bullet \bullet},
$$

we explicitly construct an isomorphism between the reflection subquoient  $G_{\bullet}(\delta)$  and  $G_{\bullet}$ (except the right-most arrows  $\longrightarrow \mu_{d_1}$ ).

The standard coordinates of  $\mathbb{C}^n$  are denoted  $u_1, \ldots, u_n$  and the standard basis is denoted  $e_1,\ldots,e_n$ . The reflection on  $\mathbb{C}^n$  with a root  $v \in \mathbb{C}^n$  and a nontrivial eigenvalue  $\lambda \in \mathbb{C}^{\times}(\lambda \neq 0)$ 1) is denoted  $s(v, \lambda)$ . Explicitly,

$$
s(v, \lambda)(w) = w - (1 - \lambda) \frac{(w, v)}{(v, v)} v.
$$

Here  $( , )$  is the standard Hermitian inner product on  $\mathbb{C}^n$  given by

$$
(v, w) = \sum_{i=1}^n v_i \overline{w}_i .
$$

When  $\lambda = -1$ , we omit  $\lambda$  and write  $s(v)$  for  $s(v, -1)$ .

In this section,

$$
\zeta = e^{\frac{\pi i}{6}}, \quad \omega = e^{\frac{2\pi i}{3}}.
$$

5.1. An admissible triplet, good basic invariants and the potential vector filed of  $G_{35} = E_6$ . The finite Coxeter group  $G_{35} = E_6$  has rank 6 and degrees 12, 9, 8, 6, 5, 2. It has 36 reflections of order two. The following six roots form a simple root system [\[16\]](#page-29-1) (see also [\[25,](#page-29-9) §3]):

$$
\alpha_1^{(35)} = e_2 - e_3 + \frac{1}{\sqrt{2}} e_5 + \sqrt{\frac{3}{2}} e_6, \quad \alpha_2^{(35)} = e_3 - e_4 - \sqrt{2} e_5,
$$
  

$$
\alpha_3^{(35)} = 2e_4, \qquad \alpha_4^{(35)} = e_3 - e_4 + \sqrt{2} e_5,
$$
  

$$
\alpha_5^{(35)} = e_2 - e_3 - \frac{1}{\sqrt{2}} e_5 - \sqrt{\frac{3}{2}} e_6, \quad \alpha_6^{(35)} = e_1 - e_2 - e_3 - e_4.
$$

Then a Coxeter element is given by

$$
g_{(35)} = s(\alpha_1^{(35)})s(\alpha_2^{(35)})s(\alpha_3^{(35)})s(\alpha_4^{(35)})s(\alpha_5^{(35)})s(\alpha_6^{(35)})
$$
.

The Coxeter element  $g_{(35)}$  is 12-regular with the following eigenvalues and eigenvectors:

$$
\zeta : q_1^{(35)} = \frac{1}{4\sqrt{3-\sqrt{3}}} \begin{bmatrix} -(1+i)(\sqrt{3}+i) \\ (1-i)(\sqrt{3}-1) \\ (1+i)(\sqrt{3}-2-i) \\ (1-i)(\sqrt{3}-1) \\ -\sqrt{2} \\ \sqrt{6} \end{bmatrix} \quad \zeta^4 : q_2^{(35)} = \frac{1}{2\sqrt{2}} \begin{bmatrix} 0 \\ -i\sqrt{2} \\ 0 \\ i\sqrt{2} \\ 1 \end{bmatrix},
$$

$$
\zeta^5 : q_3^{(35)} = \frac{1}{4\sqrt{3 + \sqrt{3}}} \begin{bmatrix} (1+i)(\sqrt{3}-i) \\ -(1-i)(1+\sqrt{3}) \\ -(1+i)(\sqrt{3}+2+i) \\ -(1-i)(1+\sqrt{3}) \\ -\sqrt{2} \\ \sqrt{6} \end{bmatrix}, \quad \zeta^7 : q_4^{(35)} = \frac{1}{4\sqrt{3 + \sqrt{3}}} \begin{bmatrix} (1-i)(\sqrt{3}+i) \\ -(1+i)(1+\sqrt{3}) \\ -(1-i)(2+\sqrt{3}-i) \\ -(1+i)(1+\sqrt{3}) \\ -\sqrt{2} \\ \sqrt{6} \end{bmatrix}
$$

$$
\zeta^{8}: q_{5}^{(35)} = \frac{1}{2\sqrt{2}} \begin{bmatrix} 0 \\ i\sqrt{2} \\ 0 \\ -i\sqrt{2} \\ 1 \end{bmatrix}, \quad \zeta^{11}: q_{6}^{(35)} = \frac{1}{4\sqrt{3-\sqrt{3}}} \begin{bmatrix} -(1-i)(\sqrt{3}-i) \\ (1+i)(\sqrt{3}-1) \\ -(1-i)(2-\sqrt{3}-i) \\ (1+i)(\sqrt{3}-1) \\ -\sqrt{2} \\ \sqrt{6} \end{bmatrix}
$$

We take an admissible triplet  $(g_{(35)}, \zeta, q_1^{(35)})$  and the  $(g_{(35)}, \zeta)$ -graded coordinates of  $\mathbb{C}^6$ associated with  $q_1^{(35)}$  $q_1^{(35)}, \ldots, q_6^{(35)}$  $_6^{(50)}$ . The set of basic invariants which is good with repect to ,

.

$$
(g_{(35)}, \zeta, q_1^{(35)}) \text{ and which is compatible with the above graded coordinates at } q_1^{(35)} \text{ is}
$$
\n
$$
x_1^{(35)} = \frac{1}{20\sqrt{3}} \left( P_{12} - \frac{209}{2304} P_8 P_2^2 - \frac{77}{576} P_6^2 + \frac{2959}{165888} P_6 P_2^3 - \frac{121}{1440} P_5^2 P_2 - \frac{737}{10616832} P_2^6 \right),
$$
\n
$$
x_2^{(35)} = \frac{1}{14\sqrt{3}} \left( P_9 - \frac{7}{120} P_5 P_2^2 \right), \quad x_3^{(35)} = \frac{3}{40\sqrt{2}} \left( P_8 - \frac{7}{24} P_6 P_2 + \frac{385}{248832} P_2^4 \right),
$$
\n
$$
x_4^{(35)} = \frac{1}{8\sqrt{6}} \left( P_6 - \frac{5}{576} P_2^3 \right), \quad x_5^{(35)} = -\frac{1}{20} P_5, \quad x_6^{(35)} = \frac{1}{24} P_2.
$$

Here

$$
P_m = \sum_{i=1}^{27} l_i^m \quad (m = 12, 9, 8, 6, 5, 2),
$$

where  $l_1, \ldots, l_{27}$  are following 27 linear polynomials [\[25,](#page-29-9) §3] (see also [\[16\]](#page-29-1)):

$$
2\sqrt{\frac{2}{3}}u_6, \quad \sqrt{\frac{2}{3}}(\pm\sqrt{3}u_5 - u_6),
$$
  
\n
$$
\pm u_2 \pm u_4 + \frac{\sqrt{3}u_5 + u_6}{\sqrt{6}}, \quad \pm u_1 \pm u_3 + \frac{\sqrt{3}u_5 + u_6}{\sqrt{6}},
$$
  
\n
$$
\pm u_2 \pm u_3 - \frac{\sqrt{3}u_5 - u_6}{\sqrt{6}}, \quad \pm u_1 \pm u_4 - \frac{\sqrt{3}u_5 - u_6}{\sqrt{6}},
$$
  
\n
$$
\pm u_3 \pm u_4 - \sqrt{\frac{2}{3}}u_6, \quad \pm u_1 \pm u_2 - \sqrt{\frac{2}{3}}u_6.
$$

The potential vector field is given as follows. For the simplicity of expression, we write  $x_{\alpha}$  instead of  $x_{\alpha}^{(35)}$  here.

$$
\mathcal{G}_{\gamma}^{(35)} = \frac{\partial}{\partial x_{7-\gamma}} \mathcal{F}_{E_6} \quad (1 \le \gamma \le 6),
$$

where

<span id="page-15-0"></span>
$$
\mathcal{F}_{E_6} = \frac{1}{2}x_1^2x_6 + x_1x_3x_4 + x_1x_2x_5
$$
  
\n
$$

**Remark 5.1.** For  $E_6$ , Saito–Yano–Sekiguchi obtained the system of flat generators  $y_m$  $(m = 12, 9, 8, 6, 5, 2)$  in [\[20,](#page-29-10) (3.3)]. They are expressed in terms of the set of invariants  $A, B, C, H, J, K$  obtained in [\[5\]](#page-29-18). If we identifiy the linear coordinates  $(u_1, \ldots, u_6) \in \mathbb{C}^6$ here and  $(x_1, x_2, x_3, y_1, y_2, y_3) \in \mathbb{C}^6$  in [\[5\]](#page-29-18) as

$$
u_1 \to \frac{x_1 + x_2 + x_3}{\sqrt{3}}, \quad u_2 \to y_3, \quad u_3 \to y_1, \quad u_4 \to y_2,
$$
  

$$
u_5 \to \frac{-x_1 - x_2 + 2x_3}{\sqrt{6}}, \quad u_6 \to \frac{x_1 - x_2}{\sqrt{2}},
$$

then

$$
P_{12} = 360K + 1000HA^{2} + 32C^{2} + 192CA^{3} + 4480B^{2}A + 12A^{6},
$$
  
\n
$$
P_{9} = 168\sqrt{3}J + 336\sqrt{3}BA^{2}, \quad P_{8} = 80H + 64CA + 12A^{4},
$$
  
\n
$$
P_{6} = 24C + 12A^{3}, \quad P_{5} = 40\sqrt{3}B, \quad P_{2} = 12A,
$$

and our set of good basic invariants and  $y_m$ 's are related as follows.

$$
x_1^{(35)} = 6\sqrt{3}y_{12}
$$
,  $x_2^{(35)} = 12y_9$ ,  $x_3^{(35)} = 3\sqrt{2}y_8$ ,  
 $x_4^{(35)} = \sqrt{\frac{3}{2}}y_6$ ,  $x_5^{(35)} = 2\sqrt{3}y_5$ ,  $x_6^{(35)} = \frac{y_2}{2}$ .

**Remark 5.2.** In [\[1,](#page-28-2) §3], Abriani obtained a set of flat invariants  $t_m$  ( $m = 12, 9, 8, 6, 5, 2$ ) and the potential of  $E_6$ . Our set of good basic invariants and his is related as follows.<sup>[1](#page-16-0)</sup>

$$
x_1^{(35)} = \frac{t_{12}}{20\sqrt{3}}, \quad x_2^{(35)} = \frac{t_9}{2\sqrt{3}}, \quad x_3^{(35)} = \frac{\sqrt{2}}{5}t_8,
$$
  

$$
x_4^{(35)} = \frac{t_6}{8\sqrt{6}}, \quad x_5^{(35)} = \frac{t_5}{20}, \quad x_6^{(35)} = \frac{t_2}{2}.
$$

Under this correspondence,  $200\mathcal{F}_{E_6}$  agrees with his potential.

5.2. An admissible triplet, good basic invariants and the potential vector field of  $F_4 = G_{28}$ . The finite Coxeter group  $F_4 = G_{28}$  has rank 4 and degrees 12, 8, 6, 2. All reflections have order two. We take the following simple roots:

$$
\alpha_1^{(28)} = e_1 - e_2, \quad \alpha_2^{(28)} = e_2 - e_3, \quad \alpha_3^{(28)} = \sqrt{2}e_3,
$$
  
 $\alpha_4^{(28)} = -\frac{1}{\sqrt{2}}(e_1 + e_2 + e_3 + e_4).$ 

$$
P_{12} \rightarrow u_{12}, P_9 \rightarrow u_9, P_8 \rightarrow u_8, P_6 \rightarrow u_6, P_5 \rightarrow u_5, P_2 \rightarrow 12u_2.
$$

<span id="page-16-0"></span><sup>&</sup>lt;sup>1</sup>However, this is under the assumption that the invariant polynomials  $P_m$  ( $m = 12, 9, 8, 6, 5, 2$ ) here correspond to the counterparts  $u_m$  in [\[1\]](#page-28-2) as

Then  $g_{(28)} = s(\alpha_1^{(28)})$  $\binom{(28)}{1}$ s $\left(\alpha_2^{(28)}\right)$  $\binom{(28)}{2}$ s $\left(\alpha_3^{(28)}\right)$  $\binom{(28)}{3}$ s $\left(\alpha_4^{(28)}\right)$  $\binom{20}{4}$  is a Coxeter element. Its eigenvalues and eigenvectors are

$$
\zeta : q_1^{(28)} = \frac{1}{2\sqrt{3} - \sqrt{3}} \begin{bmatrix} -1 + i \\ i(\sqrt{3} - 1) \\ \sqrt{3} - 1 \\ -1 - i \end{bmatrix}, \quad \zeta^5 : q_2^{(28)} = \frac{1}{2\sqrt{3} + \sqrt{3}} \begin{bmatrix} -1 + i \\ -i(1 + \sqrt{3}) \\ -1 - \sqrt{3} \\ -1 - i \end{bmatrix},
$$
  

$$
\zeta^7 : q_3^{(28)} = \frac{1}{2\sqrt{3} + \sqrt{3}} \begin{bmatrix} 1 - i \\ -1 - \sqrt{3} \\ -i(1 + \sqrt{3}) \\ -1 - i \end{bmatrix}, \quad \zeta^{11} : q_4^{(28)} = \frac{1}{2\sqrt{3} - \sqrt{3}} \begin{bmatrix} 1 - i \\ \sqrt{3} - 1 \\ i(\sqrt{3} - 1) \\ -1 - i \end{bmatrix}.
$$

Then  $(g_{(28)}, \zeta, q_1^{(28)})$  is an admissible triplet of  $G_{28} = F_4$ . The set of basic invariants which is good with respect to  $(g_{(28)}, \zeta, q_1^{(28)})$  and which is compatible at  $q_1^{(28)}$  with the  $(g_{(28)}, \zeta)$ -graded coordinates associated with  $q_\alpha^{(28)}$ 's is given as follows.

$$
x_1^{(28)} = \frac{1}{10\sqrt{3}} \left( I_{12} + \frac{2959}{20736} I_6 I_2^3 - \frac{77}{288} I_6^2 - \frac{209}{576} I_8 I_2^2 - \frac{737}{331776} I_2^6 \right),
$$
  
\n
$$
x_2^{(28)} = \frac{3}{20\sqrt{2}} \left( I_8 - \frac{7}{12} I_6 I_2 + \frac{385}{31104} I_2^4 \right),
$$
  
\n
$$
x_3^{(28)} = -\frac{i}{4\sqrt{6}} \left( I_6 - \frac{5}{144} I_2^3 \right),
$$
  
\n
$$
x_4^{(28)} = -\frac{i}{12} I_2.
$$

These agree with the one given in  $[20, (4.3)]$  $[20, (4.3)]$  $[20, (4.3)]$  <sup>2</sup> up to constant multiples. Here  $[16]$  (see also [\[7,](#page-29-6) §4])

$$
I_{2k} = (8 - 2^{2k-1})S_{2k} + \sum_{i=1}^{k-1} {2k \choose 2i} S_{2i}S_{2k-2i} \quad (k = 6, 4, 3, 1),
$$

where

$$
S_m = u_1^m + u_2^m + u_3^m + u_4^m.
$$

The potential vector field is given as follows. For the sake of simplicity, we omit the superscript from  $x_\alpha^{(28)}$  here.

$$
\mathcal{G}_{\gamma}^{(28)} = \frac{\partial}{\partial x_{5-\gamma}} \mathcal{F}_{F_4} \quad (1 \le \gamma \le 4),
$$

<span id="page-17-0"></span><sup>2</sup>As pointed out in [\[4\]](#page-29-19), there are typos in the generators given in [\[20,](#page-29-10) (4.3)]. The invariants  $y_6$  and  $y_{12}$ there should be read as

$$
y_6 = -\frac{1}{8}I_6 + \frac{15}{16}\left(\frac{I_2}{6}\right)^3
$$
,  $y_{12} = -\frac{1}{60}I_{12} + \dots + \frac{2211}{1280}\left(\frac{I_2}{6}\right)^6$ .

where

<span id="page-18-0"></span>
$$
(5.3) \quad \mathcal{F}_{F_4} = \frac{1}{2}x_1^2x_4 + x_1x_2x_3 + \frac{x_2^3x_4}{3\sqrt{2}} + \frac{1}{10}x_2^2x_4^5 + \frac{x_2x_3^2x_4^3}{\sqrt{2}} + \frac{1}{4}x_3^4x_4 + \frac{1}{14}x_3^2x_4^7 + \frac{x_4^{13}}{1716}.
$$

5.3. An admissible triplet, good basic invariants and the potential vector field of  $G_{25}$ . The duality group  $G_{25}$  has rank 3 and degrees 12, 9, 6. Every reflection of  $G_{25}$  has order three. The line system  $\mathcal{L}_3$  of  $G_{25}$  consists of 12 lines. Nine of them are the orbit of  $\mathbb{C}(e_1 + e_2 + e_3)$  by  $G(3, 1, 3)$ . The remaining 3 are the coordinate axis [\[13,](#page-29-2) §8.5.3]. Among these lines, we choose the three lines spanned by:

$$
\alpha_1^{(25)} = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}, \quad \alpha_2^{(25)} = \begin{bmatrix} \omega \\ \omega^2 \\ 1 \end{bmatrix}, \quad \alpha_3^{(25)} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}.
$$

Let  $g_{(25)} = s(\alpha_1^{(25)})$  $\binom{(25)}{1}, \omega$ )s $(\alpha_2^{25}, \omega)$ s $(\alpha_3^{(25)})$  $\binom{23}{3}$ ,  $\omega$ ). Its eigenvalues and eigenvectors are

$$
\zeta : q_1^{(25)} = \frac{1}{\sqrt{6+2\sqrt{3}}} \begin{bmatrix} 1 \\ 1+\sqrt{3} \\ 1 \end{bmatrix}, \quad \zeta^4 = \omega : q_2^{(25)} = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix},
$$
  

$$
\zeta^7 : q_3^{(25)} = \frac{1}{\sqrt{6-2\sqrt{3}}} \begin{bmatrix} 1 \\ 1-\sqrt{3} \\ 1 \end{bmatrix}.
$$

We take  $(g_{(25)}, \zeta, q_1^{(25)})$  as an admissible triplet of  $G_{25}$  and the coordinates  $z_{(25)}$  dual to  $q_{\alpha}^{(25)}$ 's as  $(g_{(25)}, \zeta)$ -graded coordinates. The set of basic invariants which is good with respect to  $(g_{(25)}, \zeta, q_1^{(25)})$  and which is compatible with  $z_{(25)}$  at  $q_1^{(25)}$  $i_1^{(20)}$  is as follows.

$$
x_1^{(25)} = \frac{8\sqrt{3}}{81} \left( C_{12} - \frac{5}{8} C_6^2 \right), \quad x_2^{(25)} = \frac{32\sqrt{2}}{9} C_9, \quad x_3^{(25)} = -\frac{\sqrt{6}}{9} C_6,
$$

where  $[15, eq. (9)]$ 

$$
C_{12} = (u_1^3 + u_2^3 + u_3^3) ((u_1^3 + u_2^3 + u_3^3)^3 + 216u_1^3u_2^3u_3^3),
$$
  
\n
$$
C_9 = (u_1^3 - u_2^3)(u_2^3 - u_3^3)(u_3^3 - u_1^3),
$$
  
\n
$$
C_6 = u_1^6 + u_2^6 + u_3^6 - 10(u_1^3u_3^3 + u_2^3u_3^3 + u_3^3u_1^3).
$$

The potential vector field is as follows. As in the previous subsections, we omit the superscript from  $x_\alpha^{(25)}$  in the equation below.

,

<span id="page-19-0"></span>(5.4)  
\n
$$
\mathcal{G}_1^{(25)} = \frac{x_1^2}{2} - \frac{1}{2} \sqrt{\frac{3}{2}} x_2^2 x_3 + \frac{x_3^4}{4}
$$
\n
$$
\mathcal{G}_2^{(25)} = x_1 x_2 - \frac{\sqrt{3}}{2} x_2 x_3^2,
$$
\n
$$
\mathcal{G}_3^{(25)} = x_1 x_3 + \frac{x_2^2}{2\sqrt{2}}.
$$

These agree with the flat coordinates and the vector potential of  $G_{25}$  obtained in [\[2,](#page-28-1) §5.3].

5.4. An admissible triplet, good basic invariants and the potential vector field of  $G_8$ . The duality group  $G_8$  has rank two and degrees 12, 8. It is generated by [\[13,](#page-29-2) §6.3]

$$
r_4 = \begin{bmatrix} 1 & 0 \\ 0 & i \end{bmatrix}, \quad r'_4 = \frac{1}{2} \begin{bmatrix} 1+i & -1+i \\ -1+i & 1+i \end{bmatrix}.
$$

We take  $g_{(8)} = r_4 r'_4$ . Its eigenvalues and eigenvectors are

$$
\zeta: \ q_1^{(8)} = \frac{1}{\sqrt{6+2\sqrt{3}}} \begin{bmatrix} 1+\sqrt{3} \\ -1-i \end{bmatrix}, \quad \zeta^5: \ q_2^{(8)} = \frac{1}{\sqrt{6-2\sqrt{3}}} \begin{bmatrix} \sqrt{3}-1 \\ 1+i \end{bmatrix}.
$$

Then  $(g_{(8)}, \zeta, q_1^{(8)})$  is an admissible triplet of  $G_8$ . The graded coordinate system dual to  $q_1^{(5)}$  $\binom{5}{1}, q_2^{(5)}$  $z_2^{(0)}$  is denoted  $z_{(5)}$ . The set of basic invariants which is good with respect to  $(g_{(8)}, \zeta, q_1^{(8)})$  and which is compatible with  $z_{(8)}$  at  $q_1^{(8)}$  $j_1^{(0)}$  is given by

$$
x_1^{(8)} = \frac{\sqrt{3}}{16}t_0
$$
,  $x_2^{(8)} = \frac{3}{8\sqrt{2}}h_0$ ,

where [\[13,](#page-29-2) §6.6]

<span id="page-19-2"></span>(5.5) 
$$
t_O = u_1^{12} - 33u_1^8u_2^4 - 33u_1^4u_2^8 + u_2^{12}, \quad h_O = u_1^8 + 14u_1^4u_2^4 + u_2^8.
$$

The potential vector field is

<span id="page-19-1"></span>(5.6) 
$$
\mathcal{G}_1^{(8)} = \frac{x_1^2}{2} + \frac{x_2^3}{3\sqrt{2}}, \quad \mathcal{G}_2^{(8)} = x_1 x_2.
$$

In the above, we omit the superscript from  $x_\alpha^{(8)}$  for simplicity. These results agree with [\[2\]](#page-28-1) and [\[9,](#page-29-13) Table C7].

5.5. An admissible triplet, good basic invariants and the potential vector field of  $G_5$ . The duality group  $G_5$  has rank two and degrees 12,6. It is generated by [\[13,](#page-29-2) §6.2]

$$
r_1 = \frac{\omega}{2} \begin{bmatrix} -1 - i & 1 - i \\ -1 - i & -1 + i \end{bmatrix} , \quad r_2' = \frac{\omega}{2} \begin{bmatrix} -1 + i & 1 - i \\ -1 - i & -1 - i \end{bmatrix} .
$$

We take  $g_{(5)} = (r'_2 r_1)^{-1}$ . Eigenvalues and eigenvectors of  $g_{(5)}$  are

$$
\zeta: q_1^{(5)} = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 1 \end{bmatrix} , \quad \zeta^7: q_2^{(5)} = \frac{1}{\sqrt{2}} \begin{bmatrix} -1 \\ 1 \end{bmatrix} .
$$

Then  $(g_{(5)}, \zeta, q_1^{(5)})$  is an admissible triplet of  $G_5$ . The graded coordinate system dual to  $q_1^{(5)}$  $q_2^{(5)}$ ,  $q_2^{(5)}$  $z_2^{(0)}$  is denoted  $z_{(5)}$ . The set of basic invariants which is good with respect to  $(g_{(5)}, \zeta, q_1^{(5)})$  and which is compatible with  $z_{(5)}$  at  $q_1^{(5)}$  $i_1^{(0)}$  is given as follows.

$$
x_1^{(5)} = -\frac{1}{12}(f_T^3 - 6i\sqrt{3}t_T^2), \quad x_2^{(5)} = -t_T
$$

where [\[13,](#page-29-2) §6.6]

<span id="page-20-1"></span>
$$
f_T = u_1^4 + 2i\sqrt{3}u_1^2u_2^2 + u_2^4
$$
,  $t_T = u_1^5u_2 - u_1u_2^5$ .

The potential vector field is

(5.7) 
$$
\mathcal{G}_1^{(5)} = \frac{x_1^2}{2} - \frac{x_2^4}{4}, \quad \mathcal{G}_2^{(5)} = x_1 x_2.
$$

In the above, we omit the superscript from  $x_\alpha^{(5)}$  for simplicity. These results agree with [\[2\]](#page-28-1) and [\[9,](#page-29-13) Table C7].

5.6. The 2-reflection subquotient of  $G_{35} = E_6$  is  $G_{28} = F_4$ . Consider the reflection subquotient of  $G_{35} = E_6$  by  $\delta = 2$  with 2-regular element  $g_{(35)}^6$ . Among the degrees of  $G_{35}$ ,  $d_1 = 12, d_3 = 8, d_4 = 6, d_6 = 2$  are divisible by  $\delta = 2$ . Therefore the  $\zeta^6$ -eigenspace  $V(g_{(35)}^6, \zeta^6)$  of  $g_{(35)}^6$  is spanned by  $q_1^{(35)}$  $\hat{q}^{(35)}_{1},q^{(35)}_{3}$  $q_3^{(35)}, q_4^{(35)}$  $q_4^{(35)}, q_6^{(35)}$  $6^{(50)}$ . Let us consider the vector space isomorphism  $V(g_{(35)}^6, \zeta^6) \to \mathbb{C}^4$  given by

<span id="page-20-0"></span>
$$
(5.8) \tq_1^{(35)} \mapsto q_1^{(28)}, \tq_3^{(35)} \mapsto q_2^{(28)}, \tq_4^{(35)} \mapsto q_3^{(28)}, \tq_6^{(35)} \mapsto q_4^{(28)}.
$$

Under this isomorphism, the reflection subquotient  $G_{35}(2)$  maps to  $GL_4(\mathbb{C})$ . We show that this map gives an isomorphism between  $G_{35}(2)$  and  $G_{28}$ . Since the degrees of the both groups coincide, the orders are the same. Therefore we only have to show that, for each generator  $s(\alpha_i^{(28)})$  $i^{(20)}$  (1  $\leq i \leq 4$ ) of  $G_{28}$ , there exists an element of  $G_{35}(2)$  which is mapped to  $s(\alpha_i^{(28)})$  $i^{(20)}$ ). As it turns out,

$$
s(2e_3) \mapsto s(\alpha_1^{(28)}),
$$
  
\n
$$
s\left(e_2 + e_4 - \frac{1}{\sqrt{2}}e_5 + \sqrt{\frac{3}{2}}e_6\right) \mapsto s(\alpha_2^{(28)}),
$$
  
\n
$$
s(2e_4) \circ s(2e_2) \mapsto s(\alpha_3^{(28)}),
$$
  
\n
$$
s(e_1 - e_2 - \sqrt{2}e_5) \circ s\left(e_1 - e_4 + \frac{1}{\sqrt{2}}e_5 + \sqrt{\frac{3}{2}}e_6\right) \mapsto s(\alpha_4^{(28)}) .
$$

Therefore  $G_{35}(2) \cong G_{28}$ .

Under the isomorphism [\(5.8\)](#page-20-0), the good basic invariants of  $G_{35}$  maps to those of  $G_{28}$  as follows:

$$
\begin{aligned} x_1^{(35)} &\mapsto x_1^{(28)}, & x_2^{(35)} &\mapsto 0, & x_3^{(35)} &\mapsto x_2^{(28)}, \\ x_4^{(35)} &\mapsto x_3^{(28)}, & x_5^{(35)} &\mapsto 0, & x_6^{(35)} &\mapsto x_4^{(28)}. \end{aligned}
$$

If we substitute these into the potential function  $\mathcal{F}_{E_6}$ , we obtain  $\mathcal{F}_{F_4}$ . Compare [\(5.1\)](#page-15-0) and  $(5.3).$  $(5.3).$ 

5.7. The 3-reflection subquotient  $G_{35} = E_6$  is  $G_{25}$ . We consider the reflection subquotient of  $G_{35} = E_6$  by  $\delta = 3$  with 3-regular element  $g_{(35)}^4$ . Among the degrees of  $G_{35} = E_6$ ,  $d_1 = 12, d_2 = 9, d_4 = 6$  are divisible by  $\delta = 3$ . Therefore the  $\zeta^4$ -eigenspace  $V(g_{(35)}^4, \zeta^4)$  of  $g_{(35)}^4$  is spanned by  $q_1^{(35)}$  $\binom{(35)}{1}, q_2^{(35)}$  $\overset{(35)}{2},q^{(35)}_{4}$  $\binom{53}{4}$ . Let us consider the vector space isomorphism  $V(g_{(35)}^4, \zeta^4) \rightarrow \mathbb{C}^3$  given by

<span id="page-21-0"></span>
$$
(5.10) \tq_1^{(35)} \mapsto e^{\frac{5\pi i}{4}} q_1^{(25)}, \tq_2^{(35)} \mapsto q_2^{(25)}, \tq_4^{(35)} \mapsto e^{\frac{3\pi i}{4}} q_3^{(25)}.
$$

Under [\(5.10\)](#page-21-0), we show that the reflection subquotient  $G_{35}(3)$  is mapped to  $G_{25} \subset$  $GL_3(\mathbb{C})$  isomorphically. As in the case of the reduction from  $G_{35}$  to  $G_{28}$ , it is enough to show that there exists an element of  $G_{35}$  which is mapped to each generator of  $G_{25}$ . Indeed we have

$$
s\left(e_2 - e_3 + \frac{1}{\sqrt{2}}e_5 + \sqrt{\frac{3}{2}}e_6\right) \circ s\left(e_2 + e_3 - \frac{1}{\sqrt{2}}e_5 - \sqrt{\frac{3}{2}}e_6\right) \mapsto s(\alpha_1^{(25)}, \omega),
$$
  

$$
s(e_3 - e_4 - \sqrt{2}e_5) \circ s(e_1 - e_2 - e_3 + e_4) \mapsto s(\alpha_2^{(25)}, \omega),
$$
  

$$
s(2e_4) \circ s(e_3 - e_4 + \sqrt{2}e_5) \mapsto s(\alpha_3^{(25)}, \omega).
$$

Therefore  $G_{35}(3)$  is isomorphic to  $G_{25}$ .

Notice that  $q_\alpha^{(35)} \mapsto a_\alpha q_\beta^{(25)}$ <sup>(25)</sup> implies the correspondence of the graded coordinates  $z_\alpha^{(35)} \mapsto$  $a_\alpha^{-1} z_\beta^{(25)}$  $\binom{20}{\beta}$  ( $\alpha = 1, 2, 4$ ) and that of good basic invariants

(5.11) 
$$
x_{\alpha}^{(35)} \mapsto a_1^{-d_{\alpha}+1} a_{\alpha}^{-1} x_{\beta}^{(25)} \ (\alpha = 1, 2, 4).
$$

See [\[10,](#page-29-0) Lemma 4.4] for the reason of the factor in the right hand side. Then, by Remark [3.4,](#page-8-2)

(5.12) 
$$
\mathcal{G}_{\beta}^{(25)} = a_1^{d_1+d_{\alpha}-1} a_{\alpha} \mathcal{G}_{\alpha}^{(35)}.
$$

Therefore under the map [\(5.10\)](#page-21-0), we have

$$
x_1^{(35)} \mapsto (e^{\frac{5\pi i}{4}})^{-12} \cdot x_1^{(25)} = -x_1^{(25)},
$$
  
\n
$$
x_2^{(35)} \mapsto (e^{\frac{5\pi i}{4}})^{-9+1} x_2^{(25)} = x_2^{(25)},
$$
  
\n
$$
x_4^{(35)} \mapsto (e^{\frac{5\pi i}{4}})^{-6+1} \cdot e^{-\frac{3\pi i}{4}} \cdot x_3^{(25)} = -x_3^{(25)},
$$
  
\n
$$
x_3^{(35)}, x_5^{(35)}, x_6^{(35)} \mapsto 0.
$$

Comparing  $(5.1)$  and  $(5.4)$ . we see that

$$
(e^{\frac{5\pi i}{4}})^{12+12} \mathcal{G}_1^{(35)} = \mathcal{G}^{(35)} \to \mathcal{G}_1^{(25)},
$$
  
\n
$$
(e^{\frac{5\pi i}{4}})^{12+9-1} \mathcal{G}_2^{(35)} = -\mathcal{G}_2^{(35)} \to \mathcal{G}_2^{(25)},
$$
  
\n
$$
(e^{\frac{5\pi i}{4}})^{12+6-1} \cdot e^{\frac{3\pi i}{4}} \mathcal{G}_4^{(35)} = \mathcal{G}_4^{(35)} \to \mathcal{G}_3^{(25)}.
$$

5.8. The 6-reflection subquotient of  $G_{28} = F_4$  is  $G_5$ . We consider the reflection quotient of  $G_{28} = F_4$  by  $\delta = 6$  with 6-regular element  $g_{(28)}^2$ . Among the degrees of  $G_{28} = F_4$ ,  $d_1 = 12$  and  $d_3 = 6$  are divisible by  $\delta = 6$ . Therefore the  $\zeta^2$ -eigenspace  $V(g_{(28)}^2, \zeta^2)$  of  $g_{(28)}^2$  is spanned by  $q_1^{(28)}$  $q_3^{(28)}, q_3^{(28)}$  $\frac{1}{3}$ . Let us consider the vector space isomorphism  $(V(g_{(28)}^2, \zeta^2) \to \mathbb{C}^2$  given by

<span id="page-22-1"></span>(5.13) 
$$
q_1^{(28)} \mapsto e^{\frac{5\pi i}{4}} q_1^{(5)}, \quad q_3^{(28)} \mapsto i q_2^{(5)}.
$$

Under the isomorphism, we show that  $G_{28}(6)$  is mapped to  $G_5 \subset GL_2(\mathbb{C})$  isomorphi-cally. <sup>[3](#page-22-0)</sup> As in the previous cases, we only have to show that there exists an element of  $G_{28}(6)$  which is mapped to each generator of  $G_5$ . This can be achieved by the following:

(5.14) 
$$
s(e_1 - e_2) \circ s(e_1 + e_3) \mapsto r_1,
$$

$$
s(\sqrt{2}e_2) \circ s\left(\frac{1}{\sqrt{2}}(e_1 - e_2 + e_3 + e_4)\right) \mapsto r_2'.
$$

Thus  $G_{28}(6) \cong G_5$ .

Under the map  $(5.13)$ , the good basic invariants of  $G_{28}$  and  $G_5$  correspond as follows.

$$
x_1^{(28)} \mapsto (e^{\frac{5\pi i}{4}})^{-12} \cdot x_1^{(5)} = -x_1^{(5)}, \quad x_3^{(28)} \mapsto (e^{\frac{5\pi i}{4}})^{-6+1} \cdot i^{-1} \cdot x_2^{(5)} = e^{\frac{\pi i}{4}} \cdot x_2^{(5)},
$$
  

$$
x_2^{(28)}, x_4^{(28)} \mapsto 0.
$$

<span id="page-22-0"></span><sup>&</sup>lt;sup>3</sup>Given the rank and the degrees, we have two candidates  $G_5$  and  $G(6, 1, 2)$  for the 6-reflection subquotient  $G_{28}(6)$  of  $G_{28}$ . We show that  $G_{28}(6) \cong G_5$  by constructing the isomorphism explicitly. The case of  $G_{25}(6)$  is similar.

Substituting these into [\(5.3\)](#page-18-0) and comparing [\(5.7\)](#page-20-1), we see that

$$
(e^{\frac{5\pi i}{4}})^{12+12} \mathcal{G}_1^{(28)} = \mathcal{G}_1^{(28)} \to \mathcal{G}_1^{(5)},
$$
  

$$
(e^{\frac{5\pi i}{4}})^{12+6-1} \cdot i \mathcal{G}_3^{(28)} = e^{\frac{7\pi i}{4}} \mathcal{G}_3^{(28)} \to \mathcal{G}_1^{(5)}.
$$

5.9. The 4-reflection subquotient  $G_{28} = F_4$  is  $G_8$ . We consider the reflection quotient of  $G_{28}$  by  $\delta = 4$  with 4-regular element  $g_{(28)}^3$ . Among the degrees of  $G_{28} = F_4$ ,  $d_1 = 12$  and  $d_2 = 8$  are divisible by  $\delta = 4$ . Therefore the  $\zeta^3$ -eigenspace  $V(g_{(28)}^3, \zeta^3)$  of  $g_{(28)}^3$  is spanned by  $q_1^{(28)}$  $q_1^{(28)}, q_2^{(28)}$ <sup>(28)</sup>. Let us consider the vector space isomorphism  $V(g_{(28)}^3, \zeta^3) \to \mathbb{C}^2$  given by  $(5.15)$ (28)  $q_1^{(28)} \mapsto q_1^{(8)}$  $q_2^{(8)}, q_2^{(28)}$  $q_2^{(28)} \mapsto q_2^{(8)}$  $\frac{1}{2}$ .

Under this isomorphism, there exists an element of  $G_{28}(4)$  which is mapped to each generator of  $G_8$  as follows:

<span id="page-23-0"></span>
$$
s(e_2 - e_3) \circ s(\sqrt{2}e_3) \mapsto r_4,
$$
  

$$
s(e_1 + e_3) \circ s\left(-\frac{1}{\sqrt{2}}(e_1 + e_2 + e_3 + e_4)\right) \mapsto r'_4.
$$

Therefore  $G_{28}(4) \cong G_8$ .

Under the map  $(5.15)$ , the good basic invariants of  $G_{28}$  and  $G_8$  correspond as follows.

 $x_1^{(28)}$  $x_1^{(28)} \mapsto x_1^{(8)}$  $\binom{8}{1}, \quad x_2^{(28)}$  $x_2^{(28)} \mapsto x_2^{(8)}$  $x_2^{(8)}, \quad x_3^{(28)}$  $\binom{28}{3}, x_4^{(28)}$  $x_4^{(20)} \mapsto 0.$ 

If we substitute these into the potential vector field of  $G_{28} = F_4$ , we obtain that of  $G_8$ . See [\(5.3\)](#page-18-0)[\(5.6\)](#page-19-1).

5.10. The 6-reflection subquotient of  $G_{25}$  is  $G_5$ . Finally let us consider the reflection subquotient of  $G_{25}$  by  $\delta = 6$  with the 6-regular element  $g_{(25)}^2$ . Among the degrees of  $G_{25}$ ,  $d_1 = 12$  and  $d_3 = 6$  are divisible by  $\delta = 6$ . Therefore the  $\zeta^2$ -eigenspace  $V(g_{(25)}^2, \zeta^2)$  of  $g_{(25)}^2$  is spanned by the eigenvectors  $q_1^{(25)}$  $\binom{(25)}{1}, q_3^{(25)}$ <sup>(25)</sup>. Let us consider the isomorphism  $V(g_{(25)}^2, \zeta^2) \to \mathbb{C}^2$ given by

(5.16) 
$$
q_1^{(25)} \mapsto q_1^{(5)}, \quad q_3^{(25)} \mapsto e^{\frac{\pi i}{4}} q_2^{(5)}.
$$

Under the isomorphism, the following elements of  $G_{25}(6)$  are mapped to the generators of  $G_5$  as follows:

<span id="page-23-1"></span>
$$
s\left(\begin{bmatrix}1\\ \omega^2\\ 1\end{bmatrix}, \omega\right) \mapsto (r_2')^2 = (r_2')^{-1}, \quad s\left(\begin{bmatrix}1\\ 0\\ 0\end{bmatrix}, \omega\right) \circ s\left(\begin{bmatrix}0\\ 0\\ 1\end{bmatrix}, \omega\right) \mapsto r_1^2 = r_1^{-1}.
$$

Thus  $G_{25}(6) \cong G_5$ .

Under the map [\(5.16\)](#page-23-1), the good basic invariants of  $G_{25}$  and  $G_5$  correspond as follows.

$$
x_1^{(25)} \mapsto x_1^{(5)}, \quad x_2^{(25)} \mapsto 0, \quad x_3^{(25)} \mapsto e^{-\frac{\pi i}{4}} x_2^{(5)}.
$$

Substitute these into [\(5.4\)](#page-19-0) and comparing with [\(5.7\)](#page-20-1), we see that

$$
\mathcal{G}_1^{(25)} \to \mathcal{G}_1^{(5)}, \quad e^{\frac{\pi i}{4}} \mathcal{G}_3^{(25)} \to \mathcal{G}_2^{(5)}.
$$

# 6. SEQUENCE OF REFLECTION SUBQUOTIENTS OF  $G_{31}$

In this section,

$$
\zeta = e^{\frac{\pi i}{12}} \ ,
$$

and  $t_O$ ,  $h_O$  are the same as  $(5.5)$ .

6.1. Admissible triplet and good basic invariants of  $G_{31}$ .  $G_{31}$  is a non-duality group of rank 4 with degrees 24, 20, 12, 8. Among 60 roots of  $G_{31}$ , 28 are those of  $G(4, 2, 4)$ :

$$
e_{\alpha} - i^k e_{\beta} \ (0 \leq \alpha < \beta \leq 4, 0 \leq k < 4), \quad e_{\alpha} \ (1 \leq \alpha \leq 4) \ ,
$$

where  $e_1, \ldots, e_4$  is the standard basic of  $\mathbb{C}^4$ . The remaining 32 roots are the  $G(4, 2, 4)$ orbit of  $e_1 + e_2 + e_3 + e_4$ . Reflections of  $G_{31}$  are the reflections of order 2 with these roots. See [\[13,](#page-29-2)  $\S6.2$ , The line system  $\mathcal{O}_4$ ]. We take the following five roots

(6.1) 
$$
\alpha_1^{(31)} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 1 \end{bmatrix}, \ \alpha_2^{(31)} = \begin{bmatrix} 1 \\ -1 \\ 0 \\ 0 \end{bmatrix}, \ \alpha_3^{(31)} = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 1 \end{bmatrix}, \ \alpha_4^{(31)} = \begin{bmatrix} 1 \\ i \\ 1 \\ -i \end{bmatrix}, \ \alpha_5^{(31)} = \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}.
$$

We put

$$
g_{(31)} = s(\alpha_1^{(31)}) \circ s(\alpha_2^{(31)}) \circ s(\alpha_3^{(31)}) \circ s(\alpha_4^{(31)}) \circ s(\alpha_5^{(31)}) .
$$

Its eigenvalues and eigenvectors are

$$
\zeta: q_1^{(31)} = \frac{1}{\sqrt{2(2-\sqrt{2})(3+\sqrt{3})}} \begin{bmatrix} \frac{(\sqrt{2}-1)(\sqrt{3}+1)(1+i)}{2} \\ -\sqrt{2}+1 \\ 1 \\ 1 \end{bmatrix},
$$
  

$$
\zeta^5: q_2^{(31)} = \frac{1}{\sqrt{2(2+\sqrt{2})(3-\sqrt{3})}} \begin{bmatrix} \frac{(\sqrt{2}+1)(\sqrt{3}+1)(1+i)}{2} \\ -\frac{(\sqrt{3}+1)(1+i)}{2} \\ 1 \end{bmatrix},
$$
  

$$
\zeta^{13}: q_3^{(31)} = \frac{1}{\sqrt{2(2+\sqrt{2})(3+\sqrt{3})}} \begin{bmatrix} -\frac{(\sqrt{2}+1)(\sqrt{3}-1)(1+i)}{2} \\ \frac{(\sqrt{3}-1)(1+i)}{2} \\ 1 \end{bmatrix},
$$
  

$$
\zeta^{17}: q_4^{(31)} = \frac{1}{\sqrt{2(2-\sqrt{2})(3-\sqrt{3})}} \begin{bmatrix} -\frac{(\sqrt{2}+1)(\sqrt{3}+1)(1+i)}{2} \\ -\frac{(\sqrt{3}+1)(1+i)}{2} \\ 1 \end{bmatrix},
$$
  

$$
\zeta^{17}: q_4^{(31)} = \frac{1}{\sqrt{2(2-\sqrt{2})(3-\sqrt{3})}} \begin{bmatrix} -\frac{(\sqrt{2}-1)(\sqrt{3}-1)(1+i)}{2} \\ -\sqrt{2}+1 \\ 1 \end{bmatrix}.
$$

Then  $(g_{(31)}, \zeta, q_1^{(31)})$  is an admissible triplet of  $G_{31}$ . The coordinate system  $z^{(31)}$  dual to  $q_1^{(31)}$  $q_1^{(31)}, \ldots, q_4^{(31)}$  $\mathcal{L}_{4}^{(31)}$  is a  $(g_{(31)}, \zeta)$ -graded coordinate system. The set of basic invariants of  $G_{31}$ which is good with respect to  $(g_{(31)}, \zeta, q_1^{(31)})$  and which is compatible with  $z^{(31)}$  at  $q_1^{(31)}$  $i^{(51)}$  is as follows.

(6.2)  
\n
$$
x_1^{(31)} = \frac{1}{6} \left( F_{24} - \frac{7}{12} F_{12}^2 + \frac{5}{16} F_8^3 \right),
$$
\n
$$
x_2^{(31)} = \sqrt{\frac{3}{2}} \left( F_{20} - \frac{11}{12} F_{12} F_8 \right),
$$
\n
$$
x_3^{(31)} = -\frac{1}{2\sqrt{3}} F_{12},
$$
\n
$$
x_4^{(31)} = -\frac{1}{2\sqrt{2}} F_8.
$$

Here  $F_{24}, F_{20}, F_{12}, F_8$  are those defined in [\[14,](#page-29-21) eqs.(7)(11)(12)]:

(6.3)  
\n
$$
F_{24} = \frac{1}{4} \Phi_1 \Phi_2 \Phi_3 \Phi_4 \Phi_5 \Phi_6,
$$
\n
$$
F_{20} = \frac{1}{12} \sum_{1 \le i < j < k < l < \le 6} \Phi_i \Phi_j \Phi_k \Phi_l \Phi_m,
$$
\n
$$
F_{12} = -\frac{1}{4} \sum_{1 \le i < j < k \le 6} \Phi_i \Phi_j \Phi_k,
$$
\n
$$
F_8 = -\frac{1}{6} \sum_{1 \le i < j \le 6} \Phi_i \Phi_j,
$$

where

$$
\begin{aligned} \Phi_1&=u_1^4+u_2^4+u_3^4+u_4^4-6(u_1^2u_2^2+u_1^2u_3^2+u_1^2u_4^2+u_2^2u_3^2+u_2^2u_4^2+u_3^2u_4^2),\\ \Phi_2&=u_1^4+u_2^4+u_3^4+u_4^4+6(-u_1^2u_2^2+u_1^2u_3^2+u_1^2u_4^2+u_2^2u_3^2+u_2^2u_4^2-u_3^2u_4^2),\\ \Phi_3&=u_1^4+u_2^4+u_3^4+u_4^4+6(u_1^2u_2^2-u_1^2u_3^2+u_1^2u_4^2+u_2^2u_3^2-u_2^2u_4^2+u_3^2u_4^2),\\ \Phi_4&=u_1^4+u_2^4+u_3^4+u_4^4+6(u_1^2u_2^2+u_1^2u_3^2-u_1^2u_4^2-u_2^2u_3^2+u_2^2u_4^2+u_3^2u_4^2),\\ \Phi_5&=-2(u_1^4+u_2^4+u_3^4+u_4^4)-24u_1u_2u_3u_4,\\ \Phi_6&=-2(u_1^4+u_2^4+u_3^4+u_4^4)+24u_1u_2u_3u_4. \end{aligned}
$$

**Remark 6.1.** The potential vector field [\(3.2\)](#page-7-1) gives the structure constants  $C_{\alpha\beta}^{\gamma} = \frac{\partial \mathcal{G}_{\gamma}}{\partial x_{\alpha}\partial \beta}$  $\partial x_\alpha \partial x_\beta$  $(1 \le \alpha, \beta, \gamma \le n)$  of a multiplication on the tangent bundle of the orbit space, and the multiplication is commutative and associative for duality groups [\[9\]](#page-29-13)[\[10\]](#page-29-0). Although  $G_{31}$  is not a duality group, we can compute [\(3.2\)](#page-7-1) and obtain the followings.

,

$$
G_1^{(31)} = \frac{x_1^2}{2} + \frac{35}{108}x_3^4 - \frac{x_2^2x_4}{3\sqrt{2}} - \frac{x_2x_3x_4^2}{\sqrt{2}} - \frac{8\sqrt{2}}{3}x_3^2x_4^3 + \frac{11}{12}x_4^6
$$
  
\n
$$
G_2^{(31)} = x_1x_2 - \frac{2}{3}x_2x_3^2 + \frac{11}{9}x_3^3x_4 + \frac{x_2x_4^3}{\sqrt{2}} - \frac{7}{2\sqrt{2}}x_3x_4^4,
$$
  
\n
$$
G_3^{(31)} = x_1x_3 + \frac{x_3^3}{9} - \frac{x_2x_4^2}{\sqrt{2}} - \frac{3}{\sqrt{2}}x_3x_4^3,
$$
  
\n
$$
G_4^{(31)} = x_1x_4 + \frac{x_2x_3}{3} + x_3^2x_4 - \frac{x_4^4}{2\sqrt{2}}.
$$

Here we write  $x_{\alpha}$  instead of  $x_{\alpha}^{(35)}$ . However, it turns out that the induced multiplication is not associative.

6.2. Admissible triplet, good basic invariants, and the potential vector field of  $G_9$ .  $G_9$  is a duality group of rank 2, with degrees 24, 8. It is generated by reflections [\[13,](#page-29-2) §6.3]

$$
r_3 = \frac{1}{2} \begin{bmatrix} 1 & -1 \\ -1 & -1 \end{bmatrix}, \quad r_4 = \begin{bmatrix} 1 & 0 \\ 0 & i \end{bmatrix}
$$

of orders 2 and 4. We put

$$
g_{(9)}=r_3r_4.
$$

Its eigenvalues and eigenvectors are as follows.

$$
\zeta: \ q_1^{(9)} = \frac{1}{\sqrt{3 + \sqrt{3}}} \begin{bmatrix} -\frac{(\sqrt{3} + 1)(1+i)}{2} \\ 1 \end{bmatrix}, \quad \zeta^{17}: \ q_2^{(9)} = \frac{1}{\sqrt{3 - \sqrt{3}}} \begin{bmatrix} \frac{(\sqrt{3} - 1)(1+i)}{2} \\ 1 \end{bmatrix}
$$

The vector  $q_1^{(9)}$  $1^{(9)}$  is a regular vector. Therefore  $(g_{(9)}, \zeta, q_1^{(9)})$  is an admissible triplet of  $G_9$  and the coordinate system dual to the basis  $q_1^{(9)}$  $\binom{9}{1}, q_2^{(9)}$  $g_2^{(9)}$  is a  $(g_{(9)}, \zeta)$ -graded coordinate system. The set of basic invariants of  $G_9$  which is good with respect to  $(g_{(9)}, \zeta, q_1^{(9)})$  and which is compatible with the  $(g_{(9)}, \zeta)$ -graded coordinate system at  $q_1^{(9)}$  $i^{(9)}$  is

(6.4) 
$$
x_1^{(9)} = \frac{9}{128} \left( t_O^2 - \frac{11}{16} h_O^3 \right), \quad x_2^{(9)} = -\frac{3}{8\sqrt{2}} h_O.
$$

The potential vector field is

(6.5) 
$$
\mathcal{G}_1^{(9)} = \frac{x_1^2}{2} + \frac{11}{12}x_2^6, \quad \mathcal{G}_2^{(9)} = x_1x_2 - \frac{x_2^4}{2\sqrt{2}}.
$$

In the above, we write  $x_{\alpha}$  for  $x_{\alpha}^{(9)}$  for simplicity. These results agree with [\[2\]](#page-28-1) and [\[9,](#page-29-13) Table C7].

6.3. Admissible triplet, good basic invariants, and the potential vector field of  $G_{10}$ .  $G_{10}$  is a duality group of rank 2, with degrees 24, 12. It is generated by reflections [\[13,](#page-29-2) §6.3]

$$
r_1 = \frac{\omega}{2} \begin{bmatrix} -1 - i & 1 - i \\ -1 - i & -1 + i \end{bmatrix} , \quad r_4' = \frac{1}{2} \begin{bmatrix} 1 + i & -1 + i \\ -1 + i & 1 + i \end{bmatrix}
$$

of orders 3 and 4. We put

 $g_{(10)} = (r_1 r_4')^5$ .

Its eigenvalues and eigenvectors are as follows.

$$
\zeta: q_1^{(10)} = \frac{1}{\sqrt{2}} \begin{bmatrix} \frac{(1+i)}{\sqrt{2}} \\ 1 \end{bmatrix}, \quad \zeta^{13}: q_2^{(10)} = \frac{1}{\sqrt{2}} \begin{bmatrix} -\frac{(1+i)}{\sqrt{2}} \\ 1 \end{bmatrix}
$$

The vector  $q_1^{(10)}$  $j_1^{(10)}$  is a regular vector. Therefore  $(g_{(10)}, \zeta, q_1^{(10)})$  is an admissible triplet of  $G_{10}$  and the coordinate system dual to the basis  $q_1^{(10)}$  $q_1^{(10)}, q_2^{(10)}$  $g_2^{(10)}$  is a  $(g_{(10)}, \zeta)$ -graded coordinate system. The set of basic invariants of  $G_{10}$  which is good with respect to  $(g_{(10)}, \zeta, q_1^{(10)})$ and which is compatible with the  $(g_{(10)}, \zeta)$ -graded coordinate system at  $q_1^{(10)}$  $i^{(10)}$  is

(6.6) 
$$
x_1^{(10)} = -\frac{8}{81} \left( h_O^3 - \frac{7}{12} t_O^2 \right), \quad x_2^{(10)} = \frac{2}{9} t_O.
$$

The potential vector field is

(6.7) 
$$
\mathcal{G}_1^{(10)} = \frac{x_1^2}{2} + \frac{35}{108}x_2^4, \quad \mathcal{G}_2^{(10)} = x_1 x_2 - \frac{x_2^3}{9}.
$$

Above, we omit the superscript from  $x_\alpha^{(10)}$  for simplicity. These results agree with [\[2\]](#page-28-1) and [\[9,](#page-29-13) Table C7].

6.4. The 8-reflection subquotient  $G_{31}$  is  $G_9$ . We consider the reflection subquotient of  $G_{31}$  by  $\delta = 8$  with 8-regular element  $g_{(31)}^3$ . Among the degrees of  $G_{31}$ ,  $d_1 = 24$  and  $d_4 = 8$  are divisible by 8. Therefore the  $\zeta^3$ -eigenspace  $V(g_{(31)}^3, \zeta^3)$  is spanned by  $q_1^{(31)}$  $\frac{(31)}{1},$  $q_4^{(31)}$ <sup>(31)</sup>. Let us consider the vector space isomorphism  $V(g_{(31)}^3, \zeta^3) \to \mathbb{C}^2$  given by

$$
q^{(31)}_1\mapsto q^{(9)}_1,\quad q^{(31)}_4\mapsto q^{(9)}_2.
$$

Under this isomorphism, the reflection subquotient  $G_{31}(8)$  maps into  $GL_2(\mathbb{C})$  and we have

<span id="page-28-3"></span>(6.8) 
$$
s(e_1 - e_2 + e_3 + e_4) \circ s(e_1 - e_4) \mapsto r_3,
$$

$$
g_{(31)} \mapsto r_3 r_4.
$$

This means that there exists an element of  $G_{31}(8)$  which is mapped to each generator of  $G_9$  and hence that  $G_9$  is contained in the image of the map. Since the degrees and hence the orders of  $G_{31}(8)$  and  $G_9$  are the same, the map gives an isomorphism between  $G_{31}(8) \cong G_9.$ 

Under the isomorphism  $(6.8)$ , the good basic invariants are mapped as follows:

$$
x_1^{(31)} \to x_1^{(9)}, \quad x_4^{(31)} \to x_2^{(9)}, \quad x_2^{(31)}, x_3^{(31)} \to 0.
$$

6.5. The 12-reflection subquotient of  $G_{31}$  is  $G_{10}$ . Finally consider the reflection subquotient of  $G_{31}$  by  $\delta = 12$  with the 12-regular element  $g_{(31)}^2$ . The degrees of  $G_{31}$  divisible by  $\delta = 12$  are  $d_1 = 24$  and  $d_3 = 12$ . Therefore the  $\zeta^2$ -eigenspace of  $V(g_{(31)}^2, \zeta^2)$  is spanned by  $q_1^{(31)}$  $\binom{(31)}{1},\ q_3^{(31)}$ <sup>(31)</sup>. Under the isomorphism of the vector spaces  $V(g_{(31)}^2, \zeta^2) \to \mathbb{C}^2$  given by

$$
q^{(31)}_1\mapsto q^{(10)}_1,\quad q^{(31)}_3\mapsto iq^{(10)}_2,\quad
$$

the reflection subquotient  $G_{31}(12)$  maps onto  $G_{10}$  since

<span id="page-28-4"></span>(6.9) 
$$
s(e_1 - e_2 + ie_3 + ie_4) \circ s(e_1 + ie_2 + e_3 - ie_4) \mapsto r_1,
$$

$$
g_{(31)}^5 \mapsto r_1 r_4'
$$

Under the isomorphism [\(6.9\)](#page-28-4), the good basic invariants are mapped as follows:

$$
x_1^{(31)} \to x_1^{(10)}, \quad x_3^{(31)} \to -ix_2^{(10)}, \quad x_2^{(31)}, x_4^{(31)} \to 0.
$$

.
