

Items	Parameters	Definitions
The Designed Game	$K = 1$	Number of sequences in the target set
	$N = 28$	Length of each sequence
	$\ell = 4$	Number of symbols filled in each time step
MCTS	$q = 400$	Number of simulations in one MCTS
	$\alpha = 0.1$	Dirichlet noise
	$\tau = 10^{-4}$ or 1	Determines the way we calculate the move selection policy based on their visiting counts
DNN	$G = 200$	Every G episodes, the DNN is updated using the experiences accumulated in the latest $z \times G$ episodes
	$z = 3$	
	$K' = 4$	Width of input image
	$N' = 7$	Length of input image
	batch = 64	Mini-batch size
