

Initialization	Initialize parameters z and DNN update cycle G . Initialize a DNN ψ_θ ; set episode $g = 0$.
Self-play to gain experience	While 1 do: Play one episode of noisy game, output each intermediate state s_i , the corresponding $\Pi(s_i)$ given by MCTS, and the discovered sequence set \mathcal{C} when the episode ends. Calculate metric $\mathcal{M}(\mathcal{C})$ and reward $\mathcal{R}(\mathcal{C})$ $\forall s_i$, store $(s_i, \Pi(s_i), \mathcal{R})$ as experience $g = g + 1$
DNN update	If $\text{mod}(i, G) == 0$: Train DNN using the experiences accumulated in the latest $z \times G$ episodes, get new DNN parameters θ' . $\psi_\theta = \psi_{\theta'}$ end If Assess ψ_θ by playing 50 noiseless games. end
