
Algorithm 1 General Reinforcement Learning NAS Algorithm

Input: Search space \mathcal{A} , number of iterations T .

Randomly initialize weights θ of the controller architecture.

for $t = 1, \dots, T$ **do**

 Train architecture $a \sim \pi(a; \theta)$, randomly sampled from the controller policy $\pi(a; \theta)$.

 Update controller parameters θ by performing a gradient update $\nabla_{\theta} E_{a \sim \pi(a; \theta)} [\mathcal{L}_{\text{val}}(a)]$.

end for

Output: Architecture selected from the trained policy $\pi(a; \theta^*)$
