 - d) Credibility of voter register
 - e) Role of observers
3. Conclusions and recommendations
4. Appendices
 - A. List of visited registration posts
 - B. Observation checklist
 - C. Statistics
 - D. List of computerized registration books with irregularities

1. Introduction

In response to an invitation issued by the National Elections Commission (CNE), The Carter Center observed the voter registration update in Mozambique (June 28 - July 15, 2004). The purpose of the mission was twofold: to demonstrate the support and interest of the international community in Mozambique's forthcoming presidential and parliamentary elections and to assess the conduct of the voter registration update.

With observers from five countries,¹ The Carter Center visited 151 registration brigades in nine provinces (list of posts visited in appendix A). The Center believes observations based on these visits provide some important lessons, representing more than 5 percent of the 2494 registration brigades across the country.

The Center's observers assessed the registration process with respect to several criteria, including the organization of the registration posts, the conduct of the registration officials, the presence of party agents and observers, and citizens' overall assessment of the process. Observers visited several posts each day throughout the registration update period and recorded their observation on a form for each station (sample in appendix B).

In addition to observing activities at registration posts, the delegation met with election officials, local observers, and civil society leaders throughout Mozambique. The Center wishes to thank all of these individuals for their time and insight in to the voter registration update.

The Center also acknowledges the support of the U.S. Agency for International Development, the U.K. Department for International Development, and the Swiss Ministry of Foreign Affairs.

2. Voter registration procedure

Voter registration in Mozambique is regulated by Law 18/2002 and is to be conducted on an annual basis. Mozambican citizens, country residents, and citizens living abroad who are aged 18 years and older by the date of the election are eligible to register as voters.

The purpose of the voter registration update is to register newly eligible voters, record transfers for citizens who have moved residence, and replace lost or stolen voter cards.

Under supervision of the National Election Commission, the Technical and Administrative Election Secretariat (STAE) conducts the voter registration update. STAE proposes the number and distribution of voter registration stations. Citizens are to

¹ The Center wishes to thank the following individuals who volunteered their time to observe the 2004 voter registration update in Mozambique: Amanda Dixon (USA), Cecilia Luna Lopes (Ecuador), Abdoulaye Kourouma (Guinée-Conakry), Jacques Saidi-Kamuleta (Democratic Republic of Congo), and Marc De Tollenaere (Belgium).

register at the assigned voter registration station close to their place of residence. Members of the police service report to the station closest to their police unit.

Typically, voter registration stations are established in local government or other public buildings such as schools and where possible, they are to coincide with polling stations. In the voter registration station, officials verify and record each voter's information to determine eligibility, take a photograph, and issue a voter card.

The voter registration staff (or brigades) consists of three members (supervisor, clerk, and photographer) at least 18 years of age. Voter registration brigade members are recruited through public competition. The CNE must inform the public of the voter registration update at least 30 days in advance through a public information campaign and the results of the update must be published at least 55 days before the election. The results are posted at each voter registration station for a period of 10 days.

3. Findings

The Center's summary findings indicate the importance of a clear distinction between the conduct of the voter registration update on the one hand (e.g. registration of new voters, voters who have changed their place of residence, or re-issue of voter cards to previously registered voters) and the public verification of the computerized registration details in the 1999 and 2003 books.

The annual update of the voter registration is a legal obligation (law 17/2002), while the opportunity for previously registered voters to verify their details in the existing registration books is not explicitly mentioned in the law. The Center was encouraged by the provision of this opportunity for all voters to verify their data in the voter register. This particular CNE decision was undoubtedly a response to complaints by voters and parties about the quality of the computerized registration books used during the 2003 municipal elections. The Carter Center cited these problems in its report on the municipal elections and thus welcomes this CNE initiative to enhance the quality and credibility of the voter register.

a) Voter registration update

The Center found registration officials were generally well trained and well equipped to perform their task. The pace of individual voter registration was also notable, with a national average of 10 minutes to process each voter.

During the last days of the registration period some brigades ran out of materials when new supplies did not arrive in time owing to transport problems. However, the Center itself did not observe cases where voters could not register at all as a result of these difficulties. It was noted that Technical Secretariat for Electoral Administration (STAE) officials also regularly had too few vehicles to transport mobile brigades or to supervise the operation of the brigades effectively. In a few cases (mainly in Zambezia) registration

officials had difficulties operating the camera equipment provided to photograph voters for their cards.

The Center was particularly pleased to note the strong participation of female registration officials, especially in the southern provinces (Inhambane, Gaza, and Maputo). In nearly half of the visited posts, Carter Center observers counted two or three women officials and only a handful were comprised of exclusively male staff (see appendix C).

Carter Center observers noted regional differences in the participation rate of urban and rural voters. Even though each brigade is responsible for approximately the same number of voters, observers found urban brigades in the southern provinces tended to register nearly twice the number of voters per day as those in rural areas. The discrepancy was even higher in the central provinces where urban brigades registered voters at a daily rate four times that of those in rural areas.

This finding requires a note of caution as the point at which observers visited brigades can influence the collected data. For example, registration brigades in rural areas tended to have a slower startup whereas most brigades recorded higher participation rates in the last days of the update period. Moreover, the calculation of provincial averages tends to erase urban-rural differences but may also allow better comparisons throughout Mozambique (see appendix D). In this case, the data gathered by the Center indicate higher daily registration rates in the central provinces and notably lower averages in Maputo Province, Gaza, and Inhambane.

Although it is difficult to identify the exact causes for these regional differences, Center observers found varying intensity of civic education, and in some cases longer distances to registration brigades may have been contributing factors. Collected data show voters in Zambezia and Nampula on average had to walk 30 minutes to reach a registration post or twice the average distance recorded in the other visited provinces. While the location of some of the 2,494 brigades may have been a contributing factor, political parties approved these locations through their representatives on the district, provincial, and national levels of the electoral authorities. The Center expects the release of detailed official registration results from STAE will enable more precise analysis of these and other voter registration patterns.

The total number of brigades deployed for the 2004 voter registration update was the same as that of the 2003 municipal election but 564 (29 percent) more than the number of brigades used for the 1999 elections. In fact, electoral authorities increased the number of brigades in eight provinces by exactly 20 percent, with sharper increases in Sofala (40 percent), Maputo Province (60 percent), and Gaza (100 percent). The discrepancies between these increases may have been a product of a perception that Sofala, Gaza, and Maputo provinces had more displaced people or damaged or lost records following the 2000 floods.

However, it is not clear to the Center why the 2003 distribution of brigades remained unchanged. The changes in geographical distribution in 2003 seem to have been driven

by a concern to cater for anticipated higher demands in areas affected by the floods of 2000. These demands were clearly no longer there in 2004, yet the distribution of brigades remained unchanged when the longer average distances to registration posts in Zambezia and Nampula indicate voters in those provinces could have also benefited from a proportionally higher number of brigades, though not necessarily by an increase, but by reconsidering the 2003 distribution. In any case, the Center regrets there are no transparent criteria and variables that would make it easy to justify and understand the existing distribution.

The allocation of brigades per province also was less balanced in 2004, based on a provincial comparison of STAE estimates of new voters per brigade. In 1999 the discrepancy between the highest (Tete) and the lowest (Niassa) was 12.5 percent, whereas in 2004 the difference between the highest (Niassa) and lowest (Cabo Delgado) was 56.4 percent. Although the preliminary results of the update do not show a visible effect, it seems to indicate a trend towards more randomness in the application of resources.

In most cases party agents from Frelimo and Renamo-UE were present. Only in four brigades visited by Center observers was an agent of another party. Carter Center observers noted, generally speaking, a friendly relationship between officials and party agents. National observers were found at posts in Inhambane, Sofala, Manica, and Tete.

When asked how voters were informed about the registration update, a large majority referred to radio announcements and civic education. Voters rarely said they had been informed by political party, religious, or traditional leaders. Media coverage of registration posts was noted in Maputo, Inhambane, and Nampula.

b) The computerized voter registration books

The Center found the computerized registration books of 1999 and 2003 generally available for public verification of voter details at the registration brigades. However, in 15 percent of the visited posts one or more registration books were not available. Most importantly, the Center observed only a limited number of voters appeared to review their inscription data.

The Center is particularly concerned about the credibility of the computerized voter roll. Center observers noted incomplete computerized registers in 10-15 percent of the visited brigades (26 cases), with remarkably lower incidences in the southern provinces compared to Sofala, Manica, and Nampula. In some instances, the books also appeared to have database errors such as the repetition of birth dates (involving 22 books observed in Sofala and Nampula). The latter errors are not considered crucial as it can be assumed an error in the recorded birth date would not impede a registered voter from exercising his or her right to vote. More worrying are the computerized registration books that appear to be incomplete because as a result, legally registered voters could be refused a ballot paper at hundreds of polling tables (detailed examples can be found in appendix D).

The Carter Center previously noted similar concerns following observation of the 2003 municipal elections. Although the full extent of these errors is difficult to calculate at this point, they do suggest subsequent STAE efforts to correct the computerized roll have yet to produce a fully clean and credible voter list.

Problems that may look like innocent organizational errors at first sight, such as incorrect covers on some books or books that were placed in the wrong brigade, can actually have serious consequences if repeated on election day because it will result in disenfranchising voters (e.g. one case of changed books may result in disenfranchising 2000 voters as it will automatically affect two polling stations).

c) Assessment of voter registration figures

The preliminary STAE results (at the time of writing CNE had not yet distributed official results) in the table below indicate the 2004 voter registration update was largely consistent with the 2003 update.

Table 1: Voter registration update, 2004

Province	STAE projection of new registrations	New registrations	Transfer registrations	Re-issued registrations	Total registrations
Niassa	38,386	34,571	9,091	18,798	62,460
Cabo Delgado	61,735	56,681	19,395	25,337	101,413
Nampula	140,090	134,665	33,908	69,058	237,631
Zambezia	145,709	128,863	31,577	71,504	231,944
Tete	57,452	61,832	11,860	14,096	87,788
Manica	52,525	43,297	13,327	17,012	73,636
Sofala	63,951	62,248	21,956	34,165	118,369
Inhambane	60,060	33,063	18,741	12,810	64,614
Gaza	61,129	44,834	23,141	23,020	90,995
Maputo Province	47,451	42,281	18,025	18,413	78,719
Maputo City	48,589	55,260	16,502	26,478	98,240
Total	777,077	697,595 (56% of registrants)	217,523 (17.5 % of registrants)	330,691 (26.5% of registrants)	1,245,809

The results in Table 1 are comparable to the 2003 update that recorded 63.3 percent new registrations, 11.5 percent transfers, and 26.5 percent re-issued registrations.

The trends in transfers and re-issued registrations also appear to have remained stable between 2003 and 2004, with the main exception of Sofala, which doubled the number of re-issued registrations from 5.2 percent of the total in 2003 to 10.4 percent in 2004. This significant increase may indicate previously registered voters misunderstood they needed to re-register this year, or they may have been influenced to do so by party officials or others in their communities.

The preliminary data also allows an estimate of the total number of registered voters who could possibly participate in the 2004 elections, based on the addition of the updated registrations in 2003 and 2004 to the roll from 1999, minus the national Mozambican annual mortality rate of 1.5 percent for persons age 18 years and older. The result of this calculation is 8,559,620 registered voters.

Table 2: Projection of voters based on new inscriptions

	1999		2003		2004		Total	%
	Registered	%	New inscriptions	%	New inscriptions	%		
Niassa	356,693	5.02	60,909	4.65	34,571	4.96	452,183	4.97
Cabo Delgado	618,451	8.71	119,870	9.16	56,681	8.13	795,020	8.73
Nampula	1,434,764	20.21	272,911	20.86	134,665	19.30	1,842,381	20.23
Zambezia	1,384,626	19.50	235,428	17.99	128,863	18.47	1,748,954	19.21
Tete	503,422	7.09	95,120	7.27	61,832	8.86	660,388	7.25
Manica	421,266	5.93	66,718	5.10	43,297	6.21	531,292	5.83
Sofala	593,877	8.37	144,680	11.06	62,248	8.92	800,824	8.79
Inhambane	495,981	6.99	53,077	4.06	33,063	4.74	582,132	6.39
Gaza	465,151	6.55	94,758	7.24	44,834	6.43	604,757	6.64
Maputo Province	369,234	5.20	75,704	5.79	42,281	6.06	487,230	5.35
Maputo City	455,640	6.42	89,417	6.83	55,260	7.92	600,330	6.59
TOTAL	7,099,105	100	1,308,592	100	697,595	100	9,105,592 (- deceased) = 8,559,620	100

This total indicates an impressive 90 percent of the total estimated population of 18 years and older or voting age population (estimated by the National Institute for Statistics at 9,511,001 eligible voters) would be registered.

This total figure is higher than the official registration rate in 1999 and 2003. If so, this discrepancy may indicate that a certain percentage of the circa 8.5 million registered voters are double registrants, a possibility confirmed by an alternative calculation of the

total number of voters in 2004 (a registration rate of 85 percent applied to the total voting age population of 9.5 million gives 8.1 million voters). Although individual motivations are difficult to determine, the Center cautions against the conclusion of a generalized intent to cheat, since many may have simply wanted to ensure they had a 2004 voter card and would be able to vote on Dec. 1-2. Despite these discrepancies, the Center is confident the overall registration figures indicate Mozambique's voter registration and subsequent update efforts have been generally fair and successful.

d) Credibility of the voter register

A further comparison between the STAE eligible and registered voter estimates and population projections published by the National Institute for Statistics (INE), based on the 1997 census, indicate some important differences. Analysis of the 1999 registration data shows the INE projections are more accurate and are the best available guide to calculate eligible and registered voter estimates. Both in 1999 and in 2003 the results of the registration done by STAE show to be much more equitable and stable compared to INE figures than to its own projections. The table below shows for 1999 that STAE provincial differences of registered voters are limited to 12 percent (highest 91 percent and lowest 79 percent) while the discrepancy is 64 percent (highest 128 percent and lowest 64 percent) against its own estimates. Again it is unclear why STAE projections differ, at times considerably, from the INE numbers.

Table 3: Voting population estimates

1999					
	INE Voting Age Population	STAE previsions	Registered voters	% INE	% STAE
Niassa	392,082	413,158	356,693	91	86
Cabo Delgado	733,624	653,600	618,451	84	95
Nampula	1,547,489	1,473,853	1,434,764	93	97
Zambezia	1,540,274	1,533,444	1,384,626	90	90
Tete	591,140	464,601	503,422	85	108
Manica	519,635	328,141	421,266	81	128
Sofala	708,058	683,904	593,877	84	87
Inhambane	617,339	687,559	495,981	80	72
Gaza	585,066	729,473	465,151	80	64
Maputo Province	467,831	440,432	369,234	79	84
Maputo City	576,598	486,685	455,640	79	94
TOTAL	8,279,136	7,894,850	7,099,105	86	90

The most difficult challenge for STAE officials will be to determine the number of voters per province, which in turn will determine the proportional distribution of parliamentary

mandates. To do this in a correct manner, it is necessary to add the number of newly registered voters currently not in the computerized registers and to subtract double registrations, the original entry of transferred voters, and the original entry of re-issued registrations.

The Center estimates this calculation involves 1,300,000 entries distributed over all existing databases. This estimate is the sum of transfers and re-issues from the registration updates of 2003 and 2004 and does not contain other double entries that can not be estimated. If STAE does not complete this major correction to the computerized voter roll, there may remain a significant discrepancy between the actual number of voters and the number of entries in the registration books. This was noted by the Center following the November 2003 municipal elections, and it is hoped it will not be repeated on a larger national scale. Given the current electoral calendar, the importance of this task cannot be underestimated.

e) Role of election observers

The Carter Center thanks those local electoral officials who greeted observers with interest and openness. However, the Center also urges the CNE and STAE to better inform provincial, district, and technical staff about the rights, duties, and role of international election observers. Although properly accredited, Center observers often were received with distrust and insecurity by local electoral officials. Indeed, many district and local officials were unaware of CNE regulations regarding election observers.

The Center also intensified its partnership with national observers before, during, and after the voter registration update through joint meetings, exchange of information and assessment methodology, and shared transportation. Nonpartisan national observers can make an important contribution to Mozambique's commitment to credible and transparent elections. The Center remains committed to continuing this collaboration.

4. Conclusions and recommendations

The following conclusions and recommendations are based on the Carter Center's observation of the 2004 voter registration update and previous observation of elections in 2003 and 1999.

a) Voter registration update

The Center found procedures for the 2004 registration of new voters, transfer records, and the re-issue of replacement voter cards were fair and generally implemented in a uniform manner.

b) Computerized voter registration books

However, the Center is more concerned about the completeness and correctness of computerized registration books and strongly encourages Mozambique's electoral

authorities to continue improving the voter register to avoid inflation of registration data and/or disenfranchisement of eligible voters.

To ensure all eligible Mozambicans have the opportunity to participate in the December elections, electoral authorities should dedicate adequate resources to implement measures that might include a thorough crosscheck of brigade supervisor reports and the manual voter registration books. Further measures could include improvements to and integration of voter registration databases, a sample-based audit of the voter register entries, and implementation of the previously announced distribution of the voter roll to political parties. The electoral authorities also could improve the transparency of the voter registration process by publicizing the steps undertaken so Mozambican voters, candidates, and political parties can have confidence in the voter roll.

c) Assessment of voter registration figures

The Carter Center recommends analysis of the registration data used as the basis for the adjustment of registration post distribution as well as adjustment of civic education strategies. Transparency would be promoted if electoral authorities publicize the criteria or formula used to determine the number of brigades per province (e.g. estimate of new voters, population density, transport requirements, and infrastructure, etc).

The Center also recommends closer institutional collaboration to reconcile difference between National Statistics Institute (INE) population projections and STAE estimates of the voting population.

d) Credibility of the voter roll

The public verification of the voter roll is one means of allowing voters to identify and correct errors, but this measure is only successful if voters understand its importance and are afforded ample opportunity to do so. The Center welcomes the CNE and STAE implementation of this procedure and encourages them to make this standard practice in future voter registration updates.

Further verification by electoral authorities adds an additional check on the quality of the voter roll. A time consuming and labor-intensive verification method is to compare all entries in the computerized books with the original information recorded in the manual books (or even the inscription forms).

A sample-based audit of the voter register is more timely and cost-effective when implemented according to a range of well-established international practices. These methods have been applied in many countries not only in response to serious concerns about the voter roll but also as a preventive measure to improve overall public confidence in the electoral process.

Sample-based audits of the voter roll can be conducted by testing a sample of information gathered from voter cards against the information in the database and vice versa by

drawing a sample from the database and checking against the information of selected voters. The databases also can be systematically checked for double inscriptions or incomplete entries. A second approach involves an area-based comparison with reference to voter registration trends since 1994. An audit requires expertise not only in the voter registration but also in statistics and database management. Audits can be implemented by any number of actors including electoral authorities, independent organizations, or private firms. Depending on national circumstances one approach may be more or less convincing.

The suggestion of an audit, first made in the Center's preliminary statement on the registration update, seems to have gained legitimacy by the ample support it generated by civil society organizations and political parties, and most recently the STAE director-general publicly stated he is open to the suggestion as a way of increasing transparency. Although the measure as such is not mentioned in the law (the same is true for the verification of computerized registration books in registration posts), the Center considers it justifiable on the basis of the competencies of the CNE as specified in Law 20/2002, article 7a/b and h.

Whatever the corrective measures decided by the CNE, the Center encourages the commission to implement them in an inclusive manner, which can be done by allowing participation, observation, or a regular and detailed flow of information.

e) Role of observers

Greater understanding of the role of international election observers (including the possible presence of long term observers well in advance and after election day) could be established during the training of election officials and by ensuring the proper distribution of CNE observation regulations to district and local officials.
