ADMINISTRATIVE GUIDANCE

A. GENERAL

Under DoD Directive 4120.15 (reference (a)), this List shall provide a single DoD-wide source document containing approved designations and popular names for all aerospace vehicles.

This List also shall include all vehicles being entered into the inventories. Aircraft with standard DoD designations operated by the U.S. Coast Guard also are included. This List includes approved mission design series (MDS) designations through 19 August 1998. See Appendix D for designators approved since last publication.

When all aerospace vehicles with a specific MDS or popular name have retired from Service inventories, the Military Departments will follow the procedures in the joint regulation (reference b)) to move them from this List to the retired list. See Appendix E for designators removed from this List.

B. OFFICE OF PRIMARY RESPONSIBILITY (OPR)

The Headquarters (HQ) United States Air Force (USAF) OPR for meeting the responsibilities directed by reference (a) is:

HQ USAF/XPPE
1070 Air Force Pentagon
Washington, D.C. 20330-1070

C. POINTS OF CONTACT FOR INQUIRIES AND CHANGES

Each Military Department shall establish a single point of contact (POC) for inquiries. (See list below.) The Air Force single POC, the Computers and Fire Control Branch, Logistics Data Management Directorate, Cataloging and Standardization Center, United States Air Force Materiel Command (AFMC/LGIS-A), also shall be the official instrumentality for the Department of Defense responsible for assigning all DoD aerospace vehicle designations and maintaining DoD aerospace vehicle lists. The Army and Navy single POCs shall be the official requestors for their respective Military Departments. Inquiries shall be forwarded to the appropriate Military Department instrumentality. Requests for changes shall be forwarded to HQ USAF/XPPE through AFMC/LGIS-A. The POCs are listed below:

CHAPTER 2

AEROSPACE VEHICLE DESIGNATION SYSTEM

A. GENERAL INFORMATION

All DoD aerospace vehicles are assigned designations referred to as MDS designators. This designation system does not permit unique or specified symbols not described in this List. The system also does not designate aerospace vehicles that are of no direct interest to the Department of Defense. A complete description of the designation system is found in the Joint Regulation (reference (b)) and in the appendices to this List. Appendix A describes and lists aircraft designators and Appendix B describes and lists rocket, probe, guided missile, and space system designators. Configuration numbers, block numbers, and serial numbers are not part of an MDS designator but are used to identify further configuration or specific vehicles. These numbers are not listed herein and do not require coordination with AFMC/LGIS-A. The following section defines the general terms used in both appendices.

The DoD MDS Designator System was changed to create a vehicle type of “Q” for Unmanned Aerial Vehicles and a basic mission category of “L”, Laser for the Airborne Laser in the aircraft section. The next revision of the Joint Regulation (reference (b)) will include these changes.

B. DEFINITION OF TERMS

The following definitions of symbols and numbers are listed in the sequence in which they would appear in an aerospace vehicle MDS.

1. Status Prefix (optional). This symbol is used only when needed to indicate that an aerospace vehicle is not standard because of its test, modification, experimental, or prototype design. For aircraft, the symbol appears to the immediate left of the modified mission symbol or basic mission symbol. For rockets and missiles, it is to the immediate left of the launch environment symbol or mission symbol.

2. Modified Mission (aircraft only) (optional). This symbol is used only when needed to identify modifications to the basic mission of an aircraft and appears to the immediate left of the basic mission symbol. Only one modified mission symbol shall be used in any one MDS.

3. Launch Environment (rockets and missiles only) (required). This symbol identifies the launch environment or platform parameters. It appears to the immediate left of the mission symbol. Only one of these symbols shall be used in any one MDS.

4. Basic Mission (required). This symbol identifies an aerospace vehicle’s primary function or capability. For standard vehicles (e.g., bombers, fighters), it appears to the immediate left of

the design number separated by a dash. For nonstandard vehicles, it appears to the immediate left of the vehicle type symbol.

5. **Vehicle Type (nonstandard vehicles only) (required)**. This symbol is required only for nonstandard vehicles, such as helicopter, vertical takeoff and landing, missile, space, etc. A **basic mission** or **modified mission** symbol must accompany the vehicle type symbol. It appears to the immediate left of the design number, separated by a dash.

6. **Design Number (required)**. This number identifies major design changes within the same basic mission. Design numbers run consecutively beginning with "1" for each category. It appears to the immediate right of the basic mission symbol or vehicle type symbol, separated by a dash.

7. **Series (required)**. This symbol identifies the first production model of a particular design number and later models representing major modifications that significantly alter the aerospace vehicle systems components or change the logistics support of the vehicle. Consecutive series symbols, starting with "A", appear to the immediate right of the design number. To avoid confusion, **do not** use the letters "I" and "O" for this symbol.

8. **Configuration or Component Number (rockets and missiles only)**. This number is used only when denoting configuration changes affecting performance, tactics, or integral components of a weapon system that require the same operations or logistics support as the aerospace vehicle. It appears to the immediate right of the series symbol separated by a dash. Each Military Department determines its own method for assigning configuration numbers.

9. **Block Number (aircraft only)**. This number identifies a production group of identically configured aircraft within a particular design series. The numbers are assigned in multiples of five (01, 05 and 10). The Military Departments may reserve intermediate block numbers for field modifications.

10. **Serial Number**. This number identifies a specific aerospace vehicle. Each Military Department determines its own method for assigning serial numbers.
