1 Overview

(`gnome atk`) wraps the Accessibility Toolkit (ATK) for Guile. It is a part of Guile-GNOME.

ATK is a technology to allow user interface elements to be traversable, readable, and writable by users that do not use the traditional combination of keyboard, screen, and mouse. This encompasses screen readers, text-to-speech, braille displays, etc.

Technically, ATK is implemented as a set of GObject interfaces that can be implemented by user interface toolkits. This is transparently translated into multiple inheritance on the Scheme level; if a class derives from `<atk-hyperlink>`, then the `<atk-hyperlink>` methods will apply to it.

The GTK+ toolkit interfaces with ATK via the `gtk-widget-get-accessible` method.

See the documentation for (`gnome gobject`) for more information on Guile-GNOME.

2 AtkAction

The ATK interface provided by UI components which the user can activate/interact with,

2.1 Overview

`<atk-action>` should be implemented by instances of `<atk-object>` classes with which the user can interact directly, i.e. buttons, checkboxes, scrollbars, e.g. components which are not "passive" providers of UI information.

Exceptions: when the user interaction is already covered by another appropriate interface such as `<atk-editable-text>` (insert/delete test, etc.) or `<atk-value>` (set value) then these actions should not be exposed by `<atk-action>` as well.

Also note that the `<atk-action>` API is limited in that parameters may not be passed to the object being activated; thus the action must be self-contained and specifiable via only a single "verb". Concrete examples include "press", "release", "click" for buttons, "drag" (meaning initiate drag) and "drop" for drag sources and drop targets, etc.

Though most UI interactions on components should be invocable via keyboard as well as mouse, there will generally be a close mapping between "mouse actions" that are possible on a component and the AtkActions. Where mouse and keyboard actions are redundant in effect, `<atk-action>` should expose only one action rather than exposing redundant actions if possible. By convention we have been using "mouse centric" terminology for `<atk-action>` names.

2.2 Usage

`<atk-action>` [Class]

Derives from `<ginterface>`.

This class defines no direct slots.

`atk-action-do-action (self <atk-action>) (i int) => (ret bool)` [Function]
`do-action` [Method]

Perform the specified action on the object.

`action` a `<gobject>` instance that implements AtkActionIface

`i` the action index corresponding to the action to be performed

`ret` ‘#t’ if success, ‘#f’ otherwise

`atk-action-get-n-actions (self <atk-action>) => (ret int)` [Function]
`get-n-actions` [Method]

Gets the number of accessible actions available on the object. If there are more than one, the first one is considered the "default" action of the object.

`action` a `<gobject>` instance that implements AtkActionIface

`ret` a the number of actions, or 0 if `action` does not implement this interface.

atk-action-get-description (<i>self <atk-action></i>) (<i>i int</i>)	[Function]
⇒ (<i>ret mchars</i>)	
get-description	[Method]
Returns a description of the specified action of the object.	
<i>action</i>	a <gobject> instance that implements AtkActionIface
<i>i</i>	the action index corresponding to the action to be performed
<i>ret</i>	a description string, or '#f' if <i>action</i> does not implement this interface.
atk-action-get-name (<i>self <atk-action></i>) (<i>i int</i>) ⇒ (<i>ret mchars</i>)	[Function]
get-name	[Method]
Returns the name of the specified action of the object.	
<i>action</i>	a <gobject> instance that implements AtkActionIface
<i>i</i>	the action index corresponding to the action to be performed
<i>ret</i>	a name string, or '#f' if <i>action</i> does not implement this interface.
atk-action-get-localized-name (<i>self <atk-action></i>) (<i>i int</i>)	[Function]
⇒ (<i>ret mchars</i>)	
get-localized-name	[Method]
Returns the localized name of the specified action of the object.	
<i>action</i>	a <gobject> instance that implements AtkActionIface
<i>i</i>	the action index corresponding to the action to be performed
<i>ret</i>	a name string, or '#f' if <i>action</i> does not implement this interface.
atk-action-get-keybinding (<i>self <atk-action></i>) (<i>i int</i>)	[Function]
⇒ (<i>ret mchars</i>)	
get-keybinding	[Method]
Returns a keybinding associated with this action, if one exists.	
<i>action</i>	a <gobject> instance that implements AtkActionIface
<i>i</i>	the action index corresponding to the action to be performed
<i>ret</i>	a string representing the keybinding, or '#f' if there is no keybinding for this action.
atk-action-set-description (<i>self <atk-action></i>) (<i>i int</i>)	[Function]
(<i>desc mchars</i>) ⇒ (<i>ret bool</i>)	
set-description	[Method]
Sets a description of the specified action of the object.	
<i>action</i>	a <gobject> instance that implements AtkActionIface
<i>i</i>	the action index corresponding to the action to be performed
<i>desc</i>	the description to be assigned to this action
<i>ret</i>	a gboolean representing if the description was successfully set;

3 AtkComponent

The ATK interface provided by UI components which occupy a physical area on the screen.

3.1 Overview

`<atk-component>` should be implemented by most if not all UI elements with an actual on-screen presence, i.e. components which can be said to have a screen-coordinate bounding box. Virtually all widgets will need to have `<atk-component>` implementations provided for their corresponding `<atk-object>` class. In short, only UI elements which are *not* GUI elements will omit this ATK interface.

A possible exception might be textual information with a transparent background, in which case text glyph bounding box information is provided by `<atk-text>`.

3.2 Usage

`<atk-component>` [Class]

Derives from `<ginterface>`.

This class defines no direct slots.

`bounds-changed (arg0 <atk-rectangle>)` [Signal on `<atk-component>`]

The "bounds-changed" signal is emitted when the bposition or size of the a component changes.

`atk-component-contains (self <atk-component>) (x int) (y int)` [Function]

`(coord_type <atk-coord-type>) ⇒ (ret bool)`

`contains` [Method]

Checks whether the specified point is within the extent of the *component*.

`component`

the `<atk-component>`

`x` x coordinate

`y` y coordinate

`coord-type`

specifies whether the coordinates are relative to the screen or to the components top level window

`ret` '#t' or '#f' indicating whether the specified point is within the extent of the *component* or not

`atk-component-get-extents (self <atk-component>)` [Function]

`(coord_type <atk-coord-type>) ⇒ (x int) (y int) (width int)`

`(height int)`

`get-extents` [Method]

Gets the rectangle which gives the extent of the *component*.

`component`

an `<atk-component>`

<i>x</i>	address of <gint> to put x coordinate	
<i>y</i>	address of <gint> to put y coordinate	
<i>width</i>	address of <gint> to put width	
<i>height</i>	address of <gint> to put height	
<i>coord-type</i>	specifies whether the coordinates are relative to the screen or to the components top level window	
atk-component-get-layer (<i>self</i> <atk-component>)		[Function]
⇒ (<i>ret</i> <atk-layer>)		
get-layer		[Method]
Gets the layer of the component.		
<i>component</i>		
an <atk-component>		
<i>ret</i>	an <atk-layer> which is the layer of the component	
atk-component-get-mdi-zorder (<i>self</i> <atk-component>)		[Function]
⇒ (<i>ret</i> int)		
get-mdi-zorder		[Method]
Gets the zorder of the component. The value G_MININT will be returned if the layer of the component is not ATK_LAYER_MDI or ATK_LAYER_WINDOW.		
<i>component</i>		
an <atk-component>		
<i>ret</i>	a gint which is the zorder of the component, i.e. the depth at which the component is shown in relation to other components in the same container.	
atk-component-get-position (<i>self</i> <atk-component>)		[Function]
(<i>coord-type</i> <atk-coord-type>) ⇒ (<i>x</i> int) (<i>y</i> int)		
get-position		[Method]
Gets the position of <i>component</i> in the form of a point specifying <i>component</i> 's top-left corner.		
<i>component</i>		
an <atk-component>		
<i>x</i>	address of <gint> to put x coordinate position	
<i>y</i>	address of <gint> to put y coordinate position	
<i>coord-type</i>	specifies whether the coordinates are relative to the screen or to the components top level window	
atk-component-get-size (<i>self</i> <atk-component>)	⇒ (<i>width</i> int)	[Function]
(<i>height</i> int)		
get-size		[Method]
Gets the size of the <i>component</i> in terms of width and height.		

component
 an <atk-component>

width address of <gint> to put width of *component*

height address of <gint> to put height of *component*

atk-component-grab-focus (*self* <atk-component>) ⇒ (*ret* bool) [Function]
grab-focus [Method]
 Grabs focus for this *component*.

component
 an <atk-component>

ret ‘#t’ if successful, ‘#f’ otherwise.

atk-component-set-extents (*self* <atk-component>) (*x* int) (*y* int) [Function]
 (*width* int) (*height* int) (*coord-type* <atk-coord-type>) ⇒ (*ret* bool)
set-extents [Method]
 Sets the extents of *component*.

component
 an <atk-component>

x *x* coordinate

y *y* coordinate

width width to set for *component*

height height to set for *component*

coord-type
 specifies whether the coordinates are relative to the screen or to the components top level window

ret ‘#t’ or ‘#f’ whether the extents were set or not

atk-component-set-position (*self* <atk-component>) (*x* int) [Function]
 (*y* int) (*coord-type* <atk-coord-type>) ⇒ (*ret* bool)
set-position [Method]
 Sets the position of *component*.

component
 an <atk-component>

x *x* coordinate

y *y* coordinate

coord-type
 specifies whether the coordinates are relative to the screen or to the components top level window

ret ‘#t’ or ‘#f’ whether or not the position was set or not

`atk-component-set-size (self <atk-component>) (width int) (height int) ⇒ (ret bool)` [Function]

set-size [Method]

Set the size of the *component* in terms of width and height.

component

an <atk-component>

width width to set for *component*

height height to set for *component*

ret ‘#t’ or ‘#f’ whether the size was set or not

`atk-component-get-alpha (self <atk-component>) ⇒ (ret double)` [Function]

[Method]

Returns the alpha value (i.e. the opacity) for this *component*, on a scale from 0 (fully transparent) to 1.0 (fully opaque).

component

an <atk-component>

ret An alpha value from 0 to 1.0, inclusive.

Since ATK 1.12

4 AtkDocument

The ATK interface which represents the toplevel container for document content.

4.1 Overview

The AtkDocument interface should be supported by any object whose content is a representation or view of a document. The AtkDocument interface should appear on the toplevel container for the document content; however AtkDocument instances may be nested (i.e. an AtkDocument may be a descendant of another AtkDocument) in those cases where one document contains "embedded content" which can reasonably be considered a document in its own right.

4.2 Usage

`<atk-document>` [Class]
 Derives from `<ginterface>`.
 This class defines no direct slots.

`load-complete` [Signal on `<atk-document>`]
 The 'load-complete' signal is emitted when a pending load of a static document has completed. This signal is to be expected by ATK clients if and when AtkDocument implementors expose ATK_STATE_BUSY. If the state of an AtkObject which implements AtkDocument does not include ATK_STATE_BUSY, it should be safe for clients to assume that the AtkDocument's static contents are fully loaded into the container. (Dynamic document contents should be exposed via other signals.)

`reload` [Signal on `<atk-document>`]
 The 'reload' signal is emitted when the contents of a document is refreshed from its source. Once 'reload' has been emitted, a matching 'load-complete' or 'load-stopped' signal should follow, which clients may await before interrogating ATK for the latest document content.

`load-stopped` [Signal on `<atk-document>`]
 The 'load-stopped' signal is emitted when a pending load of document contents is cancelled, paused, or otherwise interrupted by the user or application logic. It should not however be emitted while waiting for a resource (for instance while blocking on a file or network read) unless a user-significant timeout has occurred.

`atk-document-get-document-type (self <atk-document>)` [Function]
 \Rightarrow (`ret mchars`)

`get-document-type` [Method]
 Gets a string indicating the document type.

`document` a `<gobject>` instance that implements AtkDocumentIface

`ret` a string indicating the document type

atk-document-get-attribute-value (*self <atk-document>*) ⇒ (*ret mchars*) [Function]
 (*attribute_name mchars*) ⇒ (*ret mchars*)

get-attribute-value [Method]

Returns:

document a <gobject> instance that implements AtkDocumentIface

attribute-name

a character string representing the name of the attribute whose value is being queried.

ret a string value associated with the named attribute for this document, or NULL if a value for <attribute-name> has not been specified for this document.

Since ATK 1.12

atk-document-set-attribute-value (*self <atk-document>*) [Function]
 (*attribute_name mchars*) (*attribute_value mchars*) ⇒ (*ret bool*)

set-attribute-value [Method]

Returns:

document a <gobject> instance that implements AtkDocumentIface

attribute-name

a character string representing the name of the attribute whose value is being set.

attribute-value

a string value to be associated with <attribute-name>.

ret TRUE if <value> is successfully associated with <attribute-name> for this document, FALSE otherwise (e.g. if the document does not allow the attribute to be modified).

Since ATK 1.12

atk-document-get-locale (*self <atk-document>*) ⇒ (*ret mchars*) [Function]
get-locale [Method]

Gets a UTF-8 string indicating the POSIX-style LC_MESSAGES locale of the content of this document instance. Individual text substrings or images within this document may have a different locale, see atk_text_get_attributes and atk_image_get_image_locale.

document a <gobject> instance that implements AtkDocumentIface

ret a UTF-8 string indicating the POSIX-style LC_MESSAGES locale of the document content as a whole, or NULL if the document content does not specify a locale.

5 AtkEditableText

The ATK interface implemented by components containing user-editable text content.

5.1 Overview

`<atk-editable-text>` should be implemented by UI components which contain text which the user can edit, via the `<atk-object>` corresponding to that component (see `<atk-object>`).

`<atk-editable-text>` is a subclass of `<atk-text>`, and as such, an object which implements `<atk-editable-text>` is by definition an `<atk-text>` implementor as well.

5.2 Usage

<code><atk-editable-text></code>	[Class]
Derives from <code><ginterface></code> .	
This class defines no direct slots.	
<code>atk-editable-text-set-text-contents</code>	[Function]
<code>(self <atk-editable-text>) (string mchars)</code>	
<code>set-text-contents</code>	[Method]
Set text contents of <code>text</code> .	
<code>text</code> an <code><atk-editable-text></code>	
<code>string</code> string to set for text contents of <code>text</code>	
<code>atk-editable-text-insert-text</code> <code>(self <atk-editable-text>)</code>	[Function]
<code>(string mchars) (length int) ⇒ (position int)</code>	
<code>insert-text</code>	[Method]
Insert text at a given position.	
<code>text</code> an <code><atk-editable-text></code>	
<code>string</code> the text to insert	
<code>length</code> the length of text to insert, in bytes	
<code>position</code> The caller initializes this to the position at which to insert the text. After the call it points at the position after the newly inserted text.	
<code>atk-editable-text-copy-text</code> <code>(self <atk-editable-text>)</code>	[Function]
<code>(start_pos int) (end_pos int)</code>	
<code>copy-text</code>	[Method]
Copy text from <code>start-pos</code> up to, but not including <code>end-pos</code> to the clipboard.	
<code>text</code> an <code><atk-editable-text></code>	
<code>start-pos</code> start position	
<code>end-pos</code> end position	

```
atk-editable-text-cut-text (self <atk-editable-text>) [Function]
  (start_pos int) (end_pos int)
cut-text [Method]
  Copy text from start-pos up to, but not including end-pos to the clipboard and then
  delete from the widget.

  text      an <atk-editable-text>
  start-pos  start position
  end-pos   end position

atk-editable-text-delete-text (self <atk-editable-text>) [Function]
  (start_pos int) (end_pos int)
delete-text [Method]
  Delete text start-pos up to, but not including end-pos.

  text      an <atk-editable-text>
  start-pos  start position
  end-pos   end position

atk-editable-text-paste-text (self <atk-editable-text>) [Function]
  (position int)
paste-text [Method]
  Paste text from clipboard to specified position.

  text      an <atk-editable-text>
  position  position to paste
```

6 AtkGObjectAccessible

This object class is derived from AtkObject and can be used as a basis implementing accessible objects.

6.1 Overview

This object class is derived from AtkObject. It can be used as a basis for implementing accessible objects for GObjects which are not derived from GtkWidget. One example of its use is in providing an accessible object for GnomeCanvasItem in the GAIL library.

6.2 Usage

```
<atk-gobject-accessible> [Class]
  Derives from <atk-object>.
  This class defines no direct slots.

atk-gobject-accessible-for-object (obj <gobject>) [Function]
  ⇒ (ret <atk-object>)
  Gets the accessible object for the specified obj.
    obj      a <gobject>
    ret       a <atk-object> which is the accessible object for the obj

atk-gobject-accessible-get-object [Function]
  (self <atk-gobject-accessible>) ⇒ (ret <gobject>)
get-object [Method]
  Gets the GObject for which obj is the accessible object.
    obj      a <atk-object>
    ret       a <gobject> which is the object for which obj is the accessible objedct
```

7 AtkHyperlinkImpl

An interface from which the AtkHyperlink associated with an AtkObject may be obtained.

7.1 Overview

AtkHyperlinkImpl allows AtkObjects to refer to their associated AtkHyperlink instance, if one exists. AtkHyperlinkImpl differs from AtkHyperlink in that AtkHyperlinkImpl is an interface, whereas AtkHyperlink is a object type. The AtkHyperlinkImpl interface allows a client to query an AtkObject for the availability of an associated AtkHyperlink instance, and obtain that instance. It is thus particularly useful in cases where embedded content or inline content within a text object is present, since the embedding text object implements AtkHypertext and the inline/embedded objects are exposed as children which implement AtkHyperlinkImpl, in addition to their being obtainable via AtkHypertext:getLink followed by AtkHyperlink:getObject.

7.2 Usage

<atk-hyperlink-impl> [Class]
Derives from <ginterface>.

This class defines no direct slots.

atk-hyperlink-impl-get-hyperlink (*self* <atk-hyperlink-impl>) [Function]
 ⇒ (*ret* <atk-hyperlink>)

get-hyperlink [Method]
Gets the hyperlink associated with this object.

obj a GObject instance that implements AtkHyperlinkImplIface

ret an AtkHyperlink object which points to this implementing AtkObject.

Since ATK 1.12

8 AtkHyperlink

An ATK object which encapsulates a link or set of links in a hypertext document.

8.1 Overview

An ATK object which encapsulates a link or set of links (for instance in the case of client-side image maps) in a hypertext document. It may implement the AtkAction interface. AtkHyperlink may also be used to refer to inline embedded content, since it allows specification of a start and end offset within the host AtkHypertext object.

8.2 Usage

<atk-hyperlink>	[Class]
Derives from <atk-action> , <gobject> .	
This class defines the following slots:	
selected-link	Specifies whether the AtkHyperlink object is selected
number-of-anchors	The number of anchors associated with the AtkHyperlink object
end-index	The end index of the AtkHyperlink object
start-index	The start index of the AtkHyperlink object
link-activated	[Signal on <atk-hyperlink>] The signal link-activated is emitted when a link is activated.
atk-hyperlink-get-uri (<i>self <atk-hyperlink></i>) (<i>i int</i>)	[Function]
⇒ (<i>ret mchars</i>)	
get-uri	[Method]
Get a the URI associated with the anchor specified by <i>i</i> of <i>link</i> .	
Multiple anchors are primarily used by client-side image maps.	
<i>link</i>	an <atk-hyperlink>
<i>i</i>	a (zero-index) integer specifying the desired anchor
<i>ret</i>	a string specifying the URI
atk-hyperlink-get-object (<i>self <atk-hyperlink></i>) (<i>i int</i>)	[Function]
⇒ (<i>ret <atk-object></i>)	
get-object	[Method]
Returns the item associated with this hyperlinks nth anchor. For instance, the returned <atk-object> will implement <atk-text> if <i>link</i> is a text hyperlink, <atk-image> if <i>link</i> is an image hyperlink etc.	
Multiple anchors are primarily used by client-side image maps.	

<i>link</i>	an <atk-hyperlink>	
<i>i</i>	a (zero-index) integer specifying the desired anchor	
<i>ret</i>	an <atk-object> associated with this hyperlinks i-th anchor	
atk-hyperlink-get-end-index (<i>self</i> <atk-hyperlink>) ⇒ (<i>ret int</i>)		[Function]
get-end-index		[Method]
Gets the index with the hypertext document at which this link ends.		
<i>link</i>	an <atk-hyperlink>	
<i>ret</i>	the index with the hypertext document at which this link ends	
atk-hyperlink-get-start-index (<i>self</i> <atk-hyperlink>)		[Function]
⇒ (<i>ret int</i>)		
get-start-index		[Method]
Gets the index with the hypertext document at which this link begins.		
<i>link</i>	an <atk-hyperlink>	
<i>ret</i>	the index with the hypertext document at which this link begins	
atk-hyperlink-is-valid (<i>self</i> <atk-hyperlink>) ⇒ (<i>ret bool</i>)		[Function]
is-valid		[Method]
Since the document that a link is associated with may have changed this method returns '#t' if the link is still valid (with respect to the document it references) and '#f' otherwise.		
<i>link</i>	an <atk-hyperlink>	
<i>ret</i>	whether or not this link is still valid	
atk-hyperlink-is-inline (<i>self</i> <atk-hyperlink>) ⇒ (<i>ret bool</i>)		[Function]
is-inline		[Method]
Indicates whether the link currently displays some or all of its content inline. Ordinary HTML links will usually return '#f', but an inline <src> HTML element will return '#t'. a *		
<i>link</i>	an <atk-hyperlink>	
<i>ret</i>	whether or not this link displays its content inline.	
atk-hyperlink-get-n-anchors (<i>self</i> <atk-hyperlink>) ⇒ (<i>ret int</i>)		[Function]
get-n-anchors		[Method]
Gets the number of anchors associated with this hyperlink.		
<i>link</i>	an <atk-hyperlink>	
<i>ret</i>	the number of anchors associated with this hyperlink	
atk-hyperlink-is-selected-link (<i>self</i> <atk-hyperlink>)		[Function]
⇒ (<i>ret bool</i>)		
is-selected-link		[Method]
Determines whether this AtkHyperlink is selected		
Returns:		

link an <atk-link>

ret True if the AtkHyperlink is selected, False otherwise

Since ATK 1.4 @Deprecated: This method is deprecated since ATK version 1.8. Please use ATK_STATE_SELECTED to indicate when a hyperlink within a Hypertext container is selected.

9 AtkHypertext

The ATK interface which provides standard mechanism for manipulating hyperlinks.

9.1 Overview

An interface used for objects which implement linking between multiple resource or content locations, or multiple 'markers' within a single document. A Hypertext instance is associated with one or more Hyperlinks, which are associated with particular offsets within the Hypertext's included content. While this interface is derived from Text, there is no requirement that Hypertext instances have textual content; they may implement Image as well, and Hyperlinks need not have non-zero text offsets.

9.2 Usage

<code><atk-hypertext></code>	[Class]
Derives from <code><ginterface></code> .	
This class defines no direct slots.	
<code>link-selected (arg0 <gint>)</code>	[Signal on <code><atk-hypertext></code>]
The "link-selected" signal is emitted by an AtkHyperText object when one of the hyperlinks associated with the object is selected.	
<code>atk-hypertext-get-link (self <atk-hypertext>) (link-index int)</code>	[Function]
⇒ <code>(ret <atk-hyperlink>)</code>	
<code>get-link</code>	[Method]
Gets the link in this hypertext document at index <code>link-index</code>	
<code>hypertext</code> an <code><atk-hypertext></code>	
<code>link-index</code> an integer specifying the desired link	
<code>ret</code> the link in this hypertext document at index <code>link-index</code>	
<code>atk-hypertext-get-n-links (self <atk-hypertext>) ⇒ (ret int)</code>	[Function]
<code>get-n-links</code>	[Method]
Gets the number of links within this hypertext document.	
<code>hypertext</code> an <code><atk-hypertext></code>	
<code>ret</code> the number of links within this hypertext document	
<code>atk-hypertext-get-link-index (self <atk-hypertext>)</code>	[Function]
<code>(char-index int) ⇒ (ret int)</code>	
<code>get-link-index</code>	[Method]
Gets the index into the array of hyperlinks that is associated with the character specified by <code>char-index</code> .	
<code>hypertext</code> an <code><atk-hypertext></code>	
<code>char-index</code>	
a character index	
<code>ret</code>	
an index into the array of hyperlinks in <code>hypertext</code> , or -1 if there is no hyperlink associated with this character.	

10 AtkImage

The ATK Interface implemented by components which expose image or pixmap content on-screen.

10.1 Overview

`<atk-image>` should be implemented by `<atk-object>` subtypes on behalf of components which display image/pixmap information onscreen, and which provide information (other than just widget borders, etc.) via that image content. For instance, icons, buttons with icons, toolbar elements, and image viewing panes typically should implement `<atk-image>`.

`<atk-image>` primarily provides two types of information: coordinate information (useful for screen review mode of screenreaders, and for use by onscreen magnifiers), and descriptive information. The descriptive information is provided for alternative, text-only presentation of the most significant information present in the image.

10.2 Usage

`<atk-image>` [Class]

Derives from `<ginterface>`.

This class defines no direct slots.

`atk-image-get-image-position (self <atk-image>)` [Function]

`(coord_type <atk-coord-type>) ⇒ (x int) (y int)`

`get-image-position` [Method]

Gets the position of the image in the form of a point specifying the images top-left corner.

`image` a `<gobject>` instance that implements AtkImageIface

`x` address of `<gint>` to put x coordinate position; otherwise, -1 if value cannot be obtained.

`y` address of `<gint>` to put y coordinate position; otherwise, -1 if value cannot be obtained.

`coord-type`

specifies whether the coordinates are relative to the screen or to the components top level window

`atk-image-get-image-description (self <atk-image>)` [Function]

`⇒ (ret mchars)`

`get-image-description` [Method]

Get a textual description of this image.

`image` a `<gobject>` instance that implements AtkImageIface

`ret` a string representing the image description

atk-image-set-image-description (*self <atk-image>*) [Function]
 (*description mchars*) ⇒ (*ret bool*)
set-image-description [Method]
Sets the textual description for this image.

image a <gobject> instance that implements AtkImageIface

description a string description to set for *image*

ret boolean TRUE, or FALSE if operation could not be completed.

atk-image-get-image-size (*self <atk-image>*) ⇒ (*width int*) [Function]
 (*height int*)
get-image-size [Method]
Get the width and height in pixels for the specified image. The values of *width* and *height* are returned as -1 if the values cannot be obtained (for instance, if the object is not onscreen).

image a <gobject> instance that implements AtkImageIface

width filled with the image width, or -1 if the value cannot be obtained.

height filled with the image height, or -1 if the value cannot be obtained.

atk-image-get-image-locale (*self <atk-image>*) ⇒ (*ret mchars*) [Function]
get-image-locale [Method]
Since ATK 1.12

image An <atk-image>

ret a string corresponding to the POSIX LC_MESSAGES locale used by the image description, or NULL if the image does not specify a locale.

11 AtkNoOpObjectFactory

The AtkObjectFactory which creates an AtkNoOpObject.

11.1 Overview

The AtkObjectFactory which creates an AtkNoOpObject. An instance of this is created by an AtkRegistry if no factory type has not been specified to create an accessible object of a particular type.

11.2 Usage

<atk-no-op-object-factory> [Class]

Derives from <atk-object-factory>.

This class defines no direct slots.

atk-no-op-object-factory-new ⇒ (ret <atk-object-factory>) [Function]

Creates an instance of an <atk-object-factory> which generates primitive (non-functioning) <atk-objects>.

ret an instance of an <atk-object-factory>

12 AtkNoOpObject

An AtkObject which purports to implement all ATK interfaces.

12.1 Overview

An AtkNoOpObject is an AtkObject which purports to implement all ATK interfaces. It is the type of AtkObject which is created if an accessible object is requested for an object type for which no factory type is specified.

12.2 Usage

`<atk-no-op-object>` [Class]
Derives from `<atk-table>`, `<atk-action>`, `<atk-image>`, `<atk-value>`,
`<atk-hypertext>`, `<atk-component>`, `<atk-editable-text>`, `<atk-document>`,
`<atk-selection>`, `<atk-text>`, `<atk-object>`.

This class defines no direct slots.

`atk-no-op-object-new (obj <gobject>) ⇒ (ret <atk-object>)` [Function]
Provides a default (non-functioning stub) `<atk-object>`. Application maintainers
should not use this method.

obj a `<gobject>`

ret a default (non-functioning stub) `<atk-object>`

13 AtkObjectFactory

The base object class for a factory used to create accessible objects for objects of a specific GType.

13.1 Overview

This class is the base object class for a factory used to create an accessible object for a specific GType. The function `atk-registry-set-factory-type` is normally called to store in the registry the factory type to be used to create an accessible of a particular GType.

13.2 Usage

`<atk-object-factory>` [Class]
Derives from `<gobject>`.

This class defines no direct slots.

`atk-object-factory-invalidate (self <atk-object-factory>)` [Function]
`invalidate` [Method]

Inform *factory* that it is no longer being used to create accessibles. When called, *factory* may need to inform `<atk-objects>` which it has created that they need to be re-instantiated. Note: primarily used for runtime replacement of `<atk-object-factorys>` in object registries.

factory an `<atk-object-factory>` to invalidate

14 AtkObject

The base object class for the Accessibility Toolkit API.

14.1 Overview

This class is the primary class for accessibility support via the Accessibility ToolKit (ATK). Objects which are instances of <atk-object> (or instances of AtkObject-derived types) are queried for properties which relate basic (and generic) properties of a UI component such as name and description. Instances of <atk-object> may also be queried as to whether they implement other ATK interfaces (e.g. <atk-action>, <atk-component>, etc.), as appropriate to the role which a given UI component plays in a user interface.

All UI components in an application which provide useful information or services to the user must provide corresponding <atk-object> instances on request (in GTK+, for instance, usually on a call to `#gtk-widget-get-accessible`), either via ATK support built into the toolkit for the widget class or ancestor class, or in the case of custom widgets, if the inherited <atk-object> implementation is insufficient, via instances of a new <atk-object> subclass.

14.2 Usage

<atk-object> [Class]

Derives from <gobject>.

This class defines the following slots:

`accessible-name`

Object instance's name formatted for assistive technology access

`accessible-description`

Description of an object, formatted for assistive technology access

`accessible-parent`

Is used to notify that the parent has changed

`accessible-value`

Is used to notify that the value has changed

`accessible-role`

The accessible role of this object

`accessible-component-layer`

The accessible layer of this object

`accessible-component-mdi-zorder`

The accessible MDI value of this object

`accessible-table-caption`

Is used to notify that the table caption has changed; this property should not be used. `accessible-table-caption-object` should be used instead

`accessible-table-column-description`

Is used to notify that the table column description has changed

accessible-table-column-header
 Is used to notify that the table column header has changed

accessible-table-row-description
 Is used to notify that the table row description has changed

accessible-table-row-header
 Is used to notify that the table row header has changed

accessible-table-summary
 Is used to notify that the table summary has changed

accessible-table-caption-object
 Is used to notify that the table caption has changed

accessible-hypertext-nlinks
 The number of links which the current AtkHypertext has

children-changed (arg0 < guint >) (arg1 < gpointer >) [Signal on <atk-object>]
 The signal "children-changed" is emitted when a child is added or removed from an object. It supports two details: "add" and "remove"

focus-event (arg0 < gboolean >) [Signal on <atk-object>]
 The signal "focus-event" is emitted when an object gains or loses focus.

property-change (arg0 < gpointer >) [Signal on <atk-object>]
 The signal "property-change" is emitted when an object's property value changes. The detail identifies the name of the property whose value has changed.

state-change (arg0 < guchararray >) (arg1 < gboolean >) [Signal on <atk-object>]
 The "state-change" signal is emitted when an object's state changes. The detail value identifies the state type which has changed.

visible-data-changed [Signal on <atk-object>]
 The "visible-data-changed" signal is emitted when the visual appearance of the object changed.

active-descendant-changed (arg0 < gpointer >) [Signal on <atk-object>]
 The "active-descendant-changed" signal is emitted by an object which has the state ATK_STATE_MANAGES_DESCENDANTS when the focus object in the object changes. For instance, a table will emit the signal when the cell in the table which has focus changes.

<atk-implementor> [Class]
 Derives from <ginterface>. This class defines no direct slots.

atk-implementor-ref-accessible (self <atk-implementor>) [Function]
 ⇒ (ret <atk-object>)
ref-accessible [Method]
 Gets a reference to an object's <atk-object> implementation, if the object implements <atk-object-iface>

<i>implementor</i>	The <gobject> instance which should implement <atk-implementor-iface> if a non-null return value is required.	
<i>ret</i>	a reference to an object's <atk-object> implementation	
atk-object-get-name (<i>self</i> <atk-object>) ⇒ (<i>ret</i> mchars)		[Function]
get-name		[Method]
	Gets the accessible name of the accessible.	
<i>accessible</i>	an <atk-object>	
<i>ret</i>	a character string representing the accessible name of the object.	
atk-object-get-description (<i>self</i> <atk-object>) ⇒ (<i>ret</i> mchars)		[Function]
get-description		[Method]
	Gets the accessible description of the accessible.	
<i>accessible</i>	an <atk-object>	
<i>ret</i>	a character string representing the accessible description of the accessible.	
atk-object-get-parent (<i>self</i> <atk-object>) ⇒ (<i>ret</i> <atk-object>)		[Function]
get-parent		[Method]
	Gets the accessible parent of the accessible.	
<i>accessible</i>	an <atk-object>	
<i>ret</i>	a <atk-object> representing the accessible parent of the accessible	
atk-object-ref-accessible-child (<i>self</i> <atk-object>) (<i>i</i> int)		[Function]
⇒ (<i>ret</i> <atk-object>)		
ref-accessible-child		[Method]
	Gets a reference to the specified accessible child of the object. The accessible children are 0-based so the first accessible child is at index 0, the second at index 1 and so on.	
<i>accessible</i>	an <atk-object>	
<i>i</i>	a gint representing the position of the child, starting from 0	
<i>ret</i>	an <atk-object> representing the specified accessible child of the accessible.	
atk-object-ref-relation-set (<i>self</i> <atk-object>)		[Function]
⇒ (<i>ret</i> <atk-relation-set>)		
ref-relation-set		[Method]
	Gets the <atk-relation-set> associated with the object.	
<i>accessible</i>	an <atk-object>	
<i>ret</i>	an <atk-relation-set> representing the relation set of the object.	
atk-object-get-layer (<i>self</i> <atk-object>) ⇒ (<i>ret</i> <atk-layer>)		[Function]
get-layer		[Method]
	'atk_object_get_layer' is deprecated and should not be used in newly-written code. Use atk_component_get_layer instead.	

Gets the layer of the accessible.

Returns:

accessible an <atk-object>

ret an <atk-layer> which is the layer of the accessible

atk-object-get-mdi-zorder (*self* <atk-object>) ⇒ (*ret* int) [Function]
get-mdi-zorder [Method]

‘atk_object_get_mdi_zorder’ is deprecated and should not be used in newly-written code. Use `atk_component_get_mdi_zorder` instead.

Gets the zorder of the accessible. The value G_MININT will be returned if the layer of the accessible is not ATK_LAYER_MDI.

Returns:

accessible an <atk-object>

ret a gint which is the zorder of the accessible, i.e. the depth at which the component is shown in relation to other components in the same container.

atk-object-get-role (*self* <atk-object>) ⇒ (*ret* <atk-role>) [Function]
get-role [Method]

Gets the role of the accessible.

accessible an <atk-object>

ret an <atk-role> which is the role of the accessible

atk-object-ref-state-set (*self* <atk-object>) ⇒ (*ret* <atk-state-set>) [Function]

ref-state-set [Method]

Gets a reference to the state set of the accessible; the caller must unreferencce it when it is no longer needed.

accessible an <atk-object>

ret a reference to an <atk-state-set> which is the state set of the accessible

atk-object-get-index-in-parent (*self* <atk-object>) ⇒ (*ret* int) [Function]
get-index-in-parent [Method]

Gets the 0-based index of this accessible in its parent; returns -1 if the accessible does not have an accessible parent.

accessible an <atk-object>

ret an integer which is the index of the accessible in its parent

atk-object-set-name (*self* <atk-object>) (*name* mchars) [Function]
set-name [Method]

Sets the accessible name of the accessible.

accessible an <atk-object>

name a character string to be set as the accessible name

atk-object-set-description (<i>self <atk-object></i>) (<i>description mchars</i>)	[Function]
set-description	[Method]
Sets the accessible description of the accessible.	
<i>accessible</i> an <i><atk-object></i>	
<i>description</i>	
a character string to be set as the accessible description	
atk-object-set-parent (<i>self <atk-object></i>) (<i>parent <atk-object></i>)	[Function]
set-parent	[Method]
Sets the accessible parent of the accessible.	
<i>accessible</i> an <i><atk-object></i>	
<i>parent</i> an <i><atk-object></i> to be set as the accessible parent	
atk-object-set-role (<i>self <atk-object></i>) (<i>role <atk-role></i>)	[Function]
set-role	[Method]
Sets the role of the accessible.	
<i>accessible</i> an <i><atk-object></i>	
<i>role</i> an <i><atk-role></i> to be set as the role	
atk-object-notify-state-change (<i>self <atk-object></i>) (<i>state unsigned-int64</i>) (<i>value bool</i>)	[Function]
notify-state-change	[Method]
Emits a state-change signal for the specified state.	
<i>accessible</i> an <i><atk-object></i>	
<i>state</i> an <i><atk-state></i> whose state is changed	
<i>value</i> a gbooleean which indicates whether the state is being set on or off	
atk-object-add-relationship (<i>self <atk-object></i>) (<i>relationship <atk-relation-type></i>) (<i>target <atk-object></i>) \Rightarrow (<i>ret bool</i>)	[Function]
add-relationship	[Method]
Adds a relationship of the specified type with the specified target.	
<i>object</i> The <i><atk-object></i> to which an AtkRelation is to be added.	
<i>relationship</i>	
The <i><atk-relation-type></i> of the relation	
<i>target</i> The <i><atk-object></i> which is to be the target of the relation.	
<i>ret</i> TRUE if the relationship is added.	
atk-object-remove-relationship (<i>self <atk-object></i>) (<i>relationship <atk-relation-type></i>) (<i>target <atk-object></i>) \Rightarrow (<i>ret bool</i>)	[Function]
remove-relationship	[Method]
Removes a relationship of the specified type with the specified target.	
<i>object</i> The <i><atk-object></i> from which an AtkRelation is to be removed.	

<i>relationship</i>	The <atk-relation-type> of the relation	
<i>target</i>	The <atk-object> which is the target of the relation to be removed.	
<i>ret</i>	TRUE if the relationship is removed.	
atk-role-get-name (<i>role</i> <atk-role>) ⇒ (<i>ret</i> mchars)		[Function]
	Gets the description string describing the <atk-role> <i>role</i> .	
<i>role</i>	The <atk-role> whose name is required	
<i>ret</i>	the string describing the AtkRole	
atk-role-get-localized-name (<i>role</i> <atk-role>) ⇒ (<i>ret</i> mchars)		[Function]
	Gets the localized description string describing the <atk-role> <i>role</i> .	
<i>role</i>	The <atk-role> whose localized name is required	
<i>ret</i>	the localized string describing the AtkRole	
atk-role-for-name (<i>name</i> mchars) ⇒ (<i>ret</i> <atk-role>)		[Function]
	Get the <atk-role> type corresponding to a rolew name.	
<i>name</i>	a string which is the (non-localized) name of an ATK role.	
<i>ret</i>	the <atk-role> enumerated type corresponding to the specified name, or <atk-role-invalid> if no matching role is found.	

15 AtkRegistry

An object used to store the GType of the factories used to create an accessible object for an object of a particular GType.

15.1 Overview

The AtkRegistry is normally used to create appropriate ATK "peers" for user interface components. Application developers usually need only interact with the AtkRegistry by associating appropriate ATK implementation classes with GObject classes via the `atk-registry-set-factory-type` call, passing the appropriate GType for application custom widget classes.

15.2 Usage

<code><atk-registry></code>	[Class]
Derives from <code><gobject></code> .	
This class defines no direct slots.	
<code>atk-registry-set-factory-type (self <atk-registry>)</code>	[Function]
<code>(type <gtype>) (factory-type <gtype>)</code>	
<code>set-factory-type</code>	[Method]
Associate an <code><atk-object-factory></code> subclass with a <code><g-type></code> . Note: The associated <code>factory-type</code> will thereafter be responsible for the creation of new <code><atk-object></code> implementations for instances appropriate for <code>type</code> .	
<code>registry</code> the <code><atk-registry></code> in which to register the type association	
<code>type</code> an <code><atk-object></code> type	
<code>factory-type</code>	
an <code><atk-object-factory></code> type to associate with <code>type</code> . Must implement AtkObject appropriate for <code>type</code> .	
<code>atk-registry-get-factory-type (self <atk-registry>)</code>	[Function]
<code>(type <gtype>) ⇒ (ret <gtype>)</code>	
<code>get-factory-type</code>	[Method]
Provides a <code><g-type></code> indicating the <code><atk-object-factory></code> subclass associated with <code>type</code> .	
<code>registry</code> an <code><atk-registry></code>	
<code>type</code> a <code><g-type></code> with which to look up the associated <code><atk-object-factory></code> subclass	
<code>ret</code> a <code><g-type></code> associated with type <code>type</code>	
<code>atk-registry-get-factory (self <atk-registry>) (type <gtype>)</code>	[Function]
<code>⇒ (ret <atk-object-factory>)</code>	
<code>get-factory</code>	[Method]
Gets an <code><atk-object-factory></code> appropriate for creating <code><atk-objects></code> appropriate for <code>type</code> .	

registry an `<atk-registry>`

type a `<g-type>` with which to look up the associated `<atk-object-factory>`

ret an `<atk-object-factory>` appropriate for creating `<atk-objects>` appropriate for *type*.

atk-get-default-registry ⇒ (*ret* `<atk-registry>`) [Function]

Gets a default implementation of the `<atk-object-factory>/type` registry. Note: For most toolkit maintainers, this will be the correct registry for registering new `<atk-object>` factories. Following a call to this function, maintainers may call `atk-registry-set-factory-type` to associate an `<atk-object-factory>` subclass with the GType of objects for whom accessibility information will be provided.

ret a default implementation of the `<atk-object-factory>/type` registry

16 AtkRelationSet

A set of AtkRelations, normally the set of AtkRelations which an AtkObject has.

16.1 Overview

The AtkRelationSet held by an object establishes its relationships with objects beyond the normal "parent/child" hierarchical relationships that all user interface objects have. AtkRelationSets establish whether objects are labelled or controlled by other components, share group membership with other components (for instance within a radio-button group), or share content which "flows" between them, among other types of possible relationships.

16.2 Usage

<code><atk-relation-set></code>	[Class]
Derives from <code><gobject></code> .	
This class defines no direct slots.	
<code>atk-relation-set-new ⇒ (ret <atk-relation-set>)</code>	[Function]
Creates a new empty relation set.	
<code>ret</code> a new <code><atk-relation-set></code>	
<code>atk-relation-set-contains (self <atk-relation-set>)</code>	[Function]
<code>(relationship <atk-relation-type>) ⇒ (ret bool)</code>	
<code>contains</code>	[Method]
Determines whether the relation set contains a relation that matches the specified type.	
<code>set</code> an <code><atk-relation-set></code>	
<code>relationship</code>	
an <code><atk-relation-type></code>	
<code>ret</code> ' <code>#t</code> ' if <code>relationship</code> is the relationship type of a relation in <code>set</code> , ' <code>#f</code> ' otherwise	
<code>atk-relation-set-remove (self <atk-relation-set>)</code>	[Function]
<code>(relation <atk-relation>)</code>	
<code>remove</code>	[Method]
Removes a relation from the relation set. This function unref's the <code><atk-relation></code> so it will be deleted unless there is another reference to it.	
<code>set</code> an <code><atk-relation-set></code>	
<code>relation</code> an <code><atk-relation></code>	
<code>atk-relation-set-add (self <atk-relation-set>)</code>	[Function]
<code>(relation <atk-relation>)</code>	
<code>add</code>	[Method]
Add a new relation to the current relation set if it is not already present. This function ref's the AtkRelation so the caller of this function should unref it to ensure that it will be destroyed when the AtkRelationSet is destroyed.	

```
set      an <atk-relation-set>
relation  an <atk-relation>

atk-relation-set-get-n-relations (self <atk-relation-set>)      [Function]
    => (ret int)
get-n-relations                                         [Method]
    Determines the number of relations in a relation set.

    set      an <atk-relation-set>
    ret       an integer representing the number of relations in the set.

atk-relation-set-get-relation (self <atk-relation-set>) (i int)  [Function]
    => (ret <atk-relation>)
get-relation                                         [Method]
    Determines the relation at the specified position in the relation set.

    set      an <atk-relation-set>
    i        a gint representing a position in the set, starting from 0.
    ret       a <atk-relation>, which is the relation at position i in the set.
```

17 AtkRelation

An object used to describe a relation between a object and one or more other objects.

17.1 Overview

An AtkRelation describes a relation between an object and one or more other objects. The actual relations that an object has with other objects are defined as an AtkRelationSet, which is a set of AtkRelations.

17.2 Usage

<atk-relation>	[Class]
Derives from <gobject> .	
This class defines the following slots:	
relation-type	
The type of the relation	
target	
An array of the targets for the relation	
atk-relation-type-register (name mchars)	[Function]
⇒ (ret <atk-relation-type>)	
Associate <i>name</i> with a new <atk-relation-type>	
name	
a name string	
ret	
an <atk-relation-type> associated with <i>name</i>	
atk-relation-type-get-name (type <atk-relation-type>)	[Function]
⇒ (ret <i>mchars</i>)	
Gets the description string describing the <atk-relation-type> <i>type</i> .	
type	
The <atk-relation-type> whose name is required	
ret	
the string describing the AtkRelationType	
atk-relation-type-for-name (name mchars)	[Function]
⇒ (ret <atk-relation-type>)	
Get the <atk-relation-type> type corresponding to a relation name.	
name	
a string which is the (non-localized) name of an ATK relation type.	
ret	
the <atk-relation-type> enumerated type corresponding to the specified name, or <atk-relation-null> if no matching relation type is found.	
atk-relation-get-relation-type (self <atk-relation>)	[Function]
⇒ (ret <atk-relation-type>)	
get-relation-type	[Method]
Gets the type of <i>relation</i>	
relation	
an <atk-relation>	
ret	
the type of <i>relation</i>	

atk-relation-add-target (*self <atk-relation>*) [Function]
 (*target <atk-object>*)

add-target [Method]

Adds the specified AtkObject to the target for the relation, if it is not already present.

relation an <atk-relation>

target an <atk-object>

Since ATK 1.9

18 AtkSelection

The ATK interface implemented by container objects whose children can be selected.

18.1 Overview

`<atk-selection>` should be implemented by UI components with children which are exposed by `<atk-object-ref-child>` and `<atk-object-get-n-children>`, if the use of the parent UI component ordinarily involves selection of one or more of the objects corresponding to those `<atk-object>` children - for example, selectable lists.

Note that other types of "selection" (for instance text selection) are accomplished a other ATK interfaces - `<atk-selection>` is limited to the selection/deselection of children.

18.2 Usage

<code><atk-selection></code>	[Class]
Derives from <code><ginterface></code> .	
This class defines no direct slots.	
<code>selection-changed</code>	[Signal on <code><atk-selection></code>]
The "selection-changed" signal is emitted by an object which implements AtkSelection interface when the selection changes.	
<code>atk-selection-add-selection (self <atk-selection>) (i int)</code>	[Function]
\Rightarrow (<code>ret bool</code>)	
<code>add-selection</code>	[Method]
Adds the specified accessible child of the object to the object's selection.	
<code>selection</code> a <code><gobject></code> instance that implements AtkSelectionIface	
<code>i</code> a <code><gint></code> specifying the child index.	
<code>ret</code> TRUE if success, FALSE otherwise.	
<code>atk-selection-clear-selection (self <atk-selection>)</code>	[Function]
\Rightarrow (<code>ret bool</code>)	
<code>clear-selection</code>	[Method]
Clears the selection in the object so that no children in the object are selected.	
<code>selection</code> a <code><gobject></code> instance that implements AtkSelectionIface	
<code>ret</code> TRUE if success, FALSE otherwise.	
<code>atk-selection-ref-selection (self <atk-selection>) (i int)</code>	[Function]
\Rightarrow (<code>ret <atk-object></code>)	
<code>ref-selection</code>	[Method]
Gets a reference to the accessible object representing the specified selected child of the object. Note: callers should not rely on '#f' or on a zero value for indication of whether AtkSelectionIface is implemented, they should use type checking/interface checking macros or the <code>atk-get-accessible-value</code> convenience method.	
<code>selection</code> a <code><gobject></code> instance that implements AtkSelectionIface	

i a <gint> specifying the index in the selection set. (e.g. the *i*th selection as opposed to the *i*th child).

ret an <atk-object> representing the selected accessible , or ‘#f’ if *selection* does not implement this interface.

atk-selection-get-selection-count (*self* <atk-selection>) [Function]
 \Rightarrow (*ret* int)

get-selection-count [Method]

Gets the number of accessible children currently selected. Note: callers should not rely on ‘#f’ or on a zero value for indication of whether AtkSelectionIface is implemented, they should use type checking/interface checking macros or the **atk-get-accessible-value** convenience method.

selection a <gobject> instance that implements AtkSelectionIface

ret a gint representing the number of items selected, or 0 if *selection* does not implement this interface.

atk-selection-is-child-selected (*self* <atk-selection>) (*i* int) [Function]
 \Rightarrow (*ret* bool)

is-child-selected [Method]

Determines if the current child of this object is selected Note: callers should not rely on ‘#f’ or on a zero value for indication of whether AtkSelectionIface is implemented, they should use type checking/interface checking macros or the **atk-get-accessible-value** convenience method.

selection a <gobject> instance that implements AtkSelectionIface

i a <gint> specifying the child index.

ret a gboolean representing the specified child is selected, or 0 if *selection* does not implement this interface.

atk-selection-remove-selection (*self* <atk-selection>) (*i* int) [Function]
 \Rightarrow (*ret* bool)

remove-selection [Method]

Removes the specified child of the object from the object’s selection.

selection a <gobject> instance that implements AtkSelectionIface

i a <gint> specifying the index in the selection set. (e.g. the *i*th selection as opposed to the *i*th child).

ret TRUE if success, FALSE otherwise.

atk-selection-select-all-selection (*self* <atk-selection>) [Function]
 \Rightarrow (*ret* bool)

select-all-selection [Method]

Causes every child of the object to be selected if the object supports multiple selections.

selection a <gobject> instance that implements AtkSelectionIface

ret TRUE if success, FALSE otherwise.

19 AtkStateSet

An AtkStateSet determines a component's state set.

19.1 Overview

An AtkStateSet determines a component's state set. It is composed of a set of AtkStates.

19.2 Usage

atk-state-set-new ⇒ (ret <atk-state-set>) [Function]
 Creates a new empty state set.

ret a new <atk-state-set>

atk-state-set-is-empty (self <atk-state-set>) ⇒ (ret bool) [Function]
is-empty [Method]

Checks whether the state set is empty, i.e. has no states set.

set an <atk-state-type>

ret '#t' if set has no states set, otherwise '#f'

atk-state-set-add-state (self <atk-state-set>) [Function]
 (type <atk-state-type>) ⇒ (ret bool)
add-state [Method]

Add a new state for the specified type to the current state set if it is not already present.

set an <atk-state-set>

type an <atk-state-type>

ret '#t' if the state for type is not already in set.

atk-state-set-clear-states (self <atk-state-set>) [Function]
clear-states [Method]

Removes all states from the state set.

set an <atk-state-set>

atk-state-set-contains-state (self <atk-state-set>) [Function]
 (type <atk-state-type>) ⇒ (ret bool)
contains-state [Method]

Checks whether the state for the specified type is in the specified set.

set an <atk-state-set>

type an <atk-state-type>

ret '#t' if type is the state type is in set.

atk-state-set-remove-state (*self* <atk-state-set>) [Function]
 (*type* <atk-state-type>) ⇒ (*ret* bool)

remove-state [Method]

Removes the state for the specified type from the state set.

set an <atk-state-set>

type an <atk-type>

ret ‘#t’ if *type* was the state type is in *set*.

atk-state-set-and-sets (*self* <atk-state-set>) [Function]
 (*compare_set* <atk-state-set>) ⇒ (*ret* <atk-state-set>)

and-sets [Method]

Constructs the intersection of the two sets, returning ‘#f’ if the intersection is empty.

set an <atk-state-set>

compare-set

 another <atk-state-set>

ret a new <atk-state-set> which is the intersection of the two sets.

atk-state-set-or-sets (*self* <atk-state-set>) [Function]
 (*compare_set* <atk-state-set>) ⇒ (*ret* <atk-state-set>)

or-sets [Method]

Constructs the union of the two sets.

set an <atk-state-set>

compare-set

 another <atk-state-set>

ret a new <atk-state-set> which is the union of the two sets, returning ‘#f’
 is empty.

atk-state-set-xor-sets (*self* <atk-state-set>) [Function]
 (*compare_set* <atk-state-set>) ⇒ (*ret* <atk-state-set>)

xor-sets [Method]

Constructs the exclusive-or of the two sets, returning ‘#f’ is empty. The set returned
 by this operation contains the states in exactly one of the two sets.

set an <atk-state-set>

compare-set

 another <atk-state-set>

ret a new <atk-state-set> which contains the states which are in exactly
 one of the two sets.

20 AtkState

An AtkState describes a component's particular state.

20.1 Overview

An AtkState describes a component's particular state. The actual state of an component is described by its AtkStateSet, which is a set of AtkStates.

20.2 Usage

`atk-state-type-get-name (type <atk-state-type>)` [Function]
 \Rightarrow (`ret mchars`)

Gets the description string describing the `<atk-state-type>` *type*.

type The `<atk-state-type>` whose name is required

ret the string describing the AtkStateType

`atk-state-type-for-name (name mchars)` [Function]
 \Rightarrow (`ret <atk-state-type>`)

Gets the `<atk-state-type>` corresponding to the description string *name*.

name a character string state name

ret an `<atk-state-type>` corresponding to *name*

21 AtkStreamableContent

The ATK interface which provides access to streamable content.

21.1 Overview

An interface whereby an object allows its backing content to be streamed to clients. Typical implementors would be images or icons, HTML content, or multimedia display/rendering widgets.

Negotiation of content type is allowed. Clients may examine the backing data and transform, convert, or parse the content in order to present it in an alternate form to end-users.

The AtkStreamableContent interface is particularly useful for saving, printing, or post-processing entire documents, or for persisting alternate views of a document. If document content itself is being serialized, stored, or converted, then use of the AtkStreamableContent interface can help address performance issues. Unlike most ATK interfaces, this interface is not strongly tied to the current user-agent view of the a particular document, but may in some cases give access to the underlying model data.

21.2 Usage

`<atk-streamable-content>` [Class]

Derives from `<ginterface>`.

This class defines no direct slots.

`atk-streamable-content-get-stream` [Function]

`(self <atk-streamable-content>) (mime_type mchars)`
 \Rightarrow `(ret <gio-channel>)`

`get-stream` [Method]

Gets the content in the specified mime type.

`streamable`

a GObject instance that implements AtkStreamableContentIface

`mime-type`

a gchar* representing the mime type

`ret`

A `<gio-channel>` which contains the content in the specified mime type.

`atk-streamable-content-get-uri` [Function]

`(self <atk-streamable-content>) (mime_type mchars) \Rightarrow (ret mchars)`

`get-uri` [Method]

Get a string representing a URI in IETF standard format (see <http://www.ietf.org/rfc/rfc2396.txt>) from which the object's content may be streamed in the specified mime-type, if one is available. If mime_type is NULL, the URI for the default (and possibly only) mime-type is returned.

Note that it is possible for get_uri to return NULL but for get_stream to work nonetheless, since not all GIOChannels connect to URIs.

streamable

a GObject instance that implements AtkStreamableContentIface

mime-type

a gchar* representing the mime type, or NULL to request a URI for the default mime type.

ret

Returns a string representing a URI, or NULL if no corresponding URI can be constructed.

Since ATK 1.12

22 AtkTable

The ATK interface implemented for UI components which contain tabular or row/column information.

22.1 Overview

`<atk-table>` should be implemented by components which present elements ordered via rows and columns. It may also be used to present tree-structured information if the nodes of the trees can be said to contain multiple "columns". Individual elements of an `<atk-table>` are typically referred to as "cells", and these cells are exposed by `<atk-table>` as child `<atk-objects>` of the `<atk-table>`. Both row/column and child-index-based access to these children is provided.

Children of `<atk-table>` are frequently "lightweight" objects, that is, they may not have backing widgets in the host UI toolkit. They are therefore often transient.

Since tables are often very complex, `<atk-table>` includes provision for offering simplified summary information, as well as row and column headers and captions. Headers and captions are `<atk-objects>` which may implement other interfaces (`<atk-text>`, `<atk-image>`, etc.) as appropriate. `<atk-table>` summaries may themselves be (simplified) `<atk-tables>`, etc.

22.2 Usage

`<atk-table>` [Class]

Derives from `<ginterface>`.

This class defines no direct slots.

`row-inserted (arg0 <gint>) (arg1 <gint>)` [Signal on `<atk-table>`]

The "row-inserted" signal is emitted by an object which implements the AtkTable interface when a column is inserted.

`column-inserted (arg0 <gint>) (arg1 <gint>)` [Signal on `<atk-table>`]

The "column-inserted" signal is emitted by an object which implements the AtkTable interface when a column is inserted.

`row-deleted (arg0 <gint>) (arg1 <gint>)` [Signal on `<atk-table>`]

The "row-deleted" signal is emitted by an object which implements the AtkTable interface when a column is deleted.

`column-deleted (arg0 <gint>) (arg1 <gint>)` [Signal on `<atk-table>`]

The "column-deleted" signal is emitted by an object which implements the AtkTable interface when a column is deleted.

`row-reordered` [Signal on `<atk-table>`]

The "row-reordered" signal is emitted by an object which implements the AtkTable interface when the columns are reordered.

`column-reordered` [Signal on `<atk-table>`]

The "column-reordered" signal is emitted by an object which implements the AtkTable interface when the columns are reordered.

model-changed [Signal on <atk-table>]

The "model-changed" signal is emitted by an object which implements the AtkTable interface when the model displayed by the table changes.

atk-table-ref-at (*self* <atk-table>) (*row* int) (*column* int) [Function]

⇒ (*ret* <atk-object>)

ref-at [Method]

Get a reference to the table cell at *row*, *column*.

table a GObject instance that implements AtkTableIface

row a <gint> representing a row in *table*

column a <gint> representing a column in *table*

ret a AtkObject* representing the referred to accessible

atk-table-get-index-at (*self* <atk-table>) (*row* int) (*column* int) [Function]

⇒ (*ret* int)

get-index-at [Method]

Gets a <gint> representing the index at the specified *row* and *column*.

table a GObject instance that implements AtkTableIface

row a <gint> representing a row in *table*

column a <gint> representing a column in *table*

ret a <gint> representing the index at specified position. The value -1 is returned if the object at *row*,*column* is not a child of *table* or *table* does not implement this interface.

atk-table-get-column-at-index (*self* <atk-table>) (*index_* int) [Function]

⇒ (*ret* int)

get-column-at-index [Method]

Gets a <gint> representing the column at the specified *index*.

table a GObject instance that implements AtkTableInterface

index a <gint> representing an index in *table*

ret a gint representing the column at the specified index, or -1 if the table does not implement this interface

atk-table-get-row-at-index (*self* <atk-table>) (*index_* int) [Function]

⇒ (*ret* int)

get-row-at-index [Method]

Gets a <gint> representing the row at the specified *index*.

table a GObject instance that implements AtkTableInterface

index a <gint> representing an index in *table*

ret a gint representing the row at the specified index, or -1 if the table does not implement this interface

atk-table-get-n-columns (*self <atk-table>*) \Rightarrow (*ret int*) [Function]
get-n-columns [Method]

Gets the number of columns in the table.

table a GObject instance that implements AtkTableIface

ret a gint representing the number of columns, or 0 if value does not implement this interface.

atk-table-get-n-rows (*self <atk-table>*) \Rightarrow (*ret int*) [Function]
get-n-rows [Method]

Gets the number of rows in the table.

table a GObject instance that implements AtkTableIface

ret a gint representing the number of rows, or 0 if value does not implement this interface.

atk-table-get-column-extent-at (*self <atk-table>*) (*row int*) \Rightarrow (*ret int*) [Function]
get-column-extent-at [Method]

Gets the number of columns occupied by the accessible object at the specified *row* and *column* in the *table*.

table a GObject instance that implements AtkTableIface

row a <gint> representing a row in *table*

column a <gint> representing a column in *table*

ret a gint representing the column extent at specified position, or 0 if value does not implement this interface.

atk-table-get-row-extent-at (*self <atk-table>*) (*row int*) \Rightarrow (*ret int*) [Function]
get-row-extent-at [Method]

Gets the number of rows occupied by the accessible object at a specified *row* and *column* in the *table*.

table a GObject instance that implements AtkTableIface

row a <gint> representing a row in *table*

column a <gint> representing a column in *table*

ret a gint representing the row extent at specified position, or 0 if value does not implement this interface.

atk-table-get-caption (*self <atk-table>*) \Rightarrow (*ret <atk-object>*) [Function]
get-caption [Method]

Gets the caption for the *table*.

table a GObject instance that implements AtkTableInterface

ret a AtkObject* representing the table caption, or ‘#f’ if value does not implement this interface.

<code>atk-table-get-column-description (self <atk-table>)</code>	[Function]						
<code>(column int) ⇒ (ret mchars)</code>							
<code>get-column-description</code>	[Method]						
Gets the description text of the specified <i>column</i> in the table							
<table><tr> <td><i>table</i></td><td>a GObject instance that implements AtkTableIface</td></tr> <tr> <td><i>column</i></td><td>a <gint> representing a column in <i>table</i></td></tr> <tr> <td><i>ret</i></td><td>a gchar* representing the column description, or '#f' if value does not implement this interface.</td></tr> </table>	<i>table</i>	a GObject instance that implements AtkTableIface	<i>column</i>	a <gint> representing a column in <i>table</i>	<i>ret</i>	a gchar* representing the column description, or '#f' if value does not implement this interface.	
<i>table</i>	a GObject instance that implements AtkTableIface						
<i>column</i>	a <gint> representing a column in <i>table</i>						
<i>ret</i>	a gchar* representing the column description, or '#f' if value does not implement this interface.						
<code>atk-table-get-row-description (self <atk-table>) (row int)</code>	[Function]						
<code>⇒ (ret mchars)</code>							
<code>get-row-description</code>	[Method]						
Gets the description text of the specified row in the table							
<table><tr> <td><i>table</i></td><td>a GObject instance that implements AtkTableIface</td></tr> <tr> <td><i>row</i></td><td>a <gint> representing a row in <i>table</i></td></tr> <tr> <td><i>ret</i></td><td>a gchar* representing the row description, or '#f' if value does not implement this interface.</td></tr> </table>	<i>table</i>	a GObject instance that implements AtkTableIface	<i>row</i>	a <gint> representing a row in <i>table</i>	<i>ret</i>	a gchar* representing the row description, or '#f' if value does not implement this interface.	
<i>table</i>	a GObject instance that implements AtkTableIface						
<i>row</i>	a <gint> representing a row in <i>table</i>						
<i>ret</i>	a gchar* representing the row description, or '#f' if value does not implement this interface.						
<code>atk-table-get-column-header (self <atk-table>) (column int)</code>	[Function]						
<code>⇒ (ret <atk-object>)</code>							
<code>get-column-header</code>	[Method]						
Gets the column header of a specified column in an accessible table.							
<table><tr> <td><i>table</i></td><td>a GObject instance that implements AtkTableIface</td></tr> <tr> <td><i>column</i></td><td>a <gint> representing a column in the table</td></tr> <tr> <td><i>ret</i></td><td>a AtkObject* representing the specified column header, or '#f' if value does not implement this interface.</td></tr> </table>	<i>table</i>	a GObject instance that implements AtkTableIface	<i>column</i>	a <gint> representing a column in the table	<i>ret</i>	a AtkObject* representing the specified column header, or '#f' if value does not implement this interface.	
<i>table</i>	a GObject instance that implements AtkTableIface						
<i>column</i>	a <gint> representing a column in the table						
<i>ret</i>	a AtkObject* representing the specified column header, or '#f' if value does not implement this interface.						
<code>atk-table-get-row-header (self <atk-table>) (row int)</code>	[Function]						
<code>⇒ (ret <atk-object>)</code>							
<code>get-row-header</code>	[Method]						
Gets the row header of a specified row in an accessible table.							
<table><tr> <td><i>table</i></td><td>a GObject instance that implements AtkTableIface</td></tr> <tr> <td><i>row</i></td><td>a <gint> representing a row in the table</td></tr> <tr> <td><i>ret</i></td><td>a AtkObject* representing the specified row header, or '#f' if value does not implement this interface.</td></tr> </table>	<i>table</i>	a GObject instance that implements AtkTableIface	<i>row</i>	a <gint> representing a row in the table	<i>ret</i>	a AtkObject* representing the specified row header, or '#f' if value does not implement this interface.	
<i>table</i>	a GObject instance that implements AtkTableIface						
<i>row</i>	a <gint> representing a row in the table						
<i>ret</i>	a AtkObject* representing the specified row header, or '#f' if value does not implement this interface.						
<code>atk-table-get-summary (self <atk-table>) ⇒ (ret <atk-object>)</code>	[Function]						
<code>get-summary</code>	[Method]						
Gets the summary description of the table.							
<table><tr> <td><i>table</i></td><td>a GObject instance that implements AtkTableIface</td></tr> <tr> <td><i>ret</i></td><td>a AtkObject* representing a summary description of the table, or zero if value does not implement this interface.</td></tr> </table>	<i>table</i>	a GObject instance that implements AtkTableIface	<i>ret</i>	a AtkObject* representing a summary description of the table, or zero if value does not implement this interface.			
<i>table</i>	a GObject instance that implements AtkTableIface						
<i>ret</i>	a AtkObject* representing a summary description of the table, or zero if value does not implement this interface.						

atk-table-set-caption (<i>self <atk-table></i>) (<i>caption <atk-object></i>)	[Function]						
set-caption	[Method]						
Sets the caption for the table.							
<table><tr><td><i>table</i></td><td>a GObject instance that implements AtkTableIface</td></tr><tr><td><i>caption</i></td><td>a <atk-object> representing the caption to set for <i>table</i></td></tr></table>	<i>table</i>	a GObject instance that implements AtkTableIface	<i>caption</i>	a <atk-object> representing the caption to set for <i>table</i>			
<i>table</i>	a GObject instance that implements AtkTableIface						
<i>caption</i>	a <atk-object> representing the caption to set for <i>table</i>						
atk-table-set-row-description (<i>self <atk-table></i>) (<i>row int</i>)	[Function]						
(<i>description mchars</i>)							
set-row-description	[Method]						
Sets the description text for the specified <i>row</i> of <i>table</i> .							
<table><tr><td><i>table</i></td><td>a GObject instance that implements AtkTableIface</td></tr><tr><td><i>row</i></td><td>a <gint> representing a row in <i>table</i></td></tr><tr><td><i>description</i></td><td>a <gchar> representing the description text to set for the specified <i>row</i> of <i>table</i></td></tr></table>	<i>table</i>	a GObject instance that implements AtkTableIface	<i>row</i>	a <gint> representing a row in <i>table</i>	<i>description</i>	a <gchar> representing the description text to set for the specified <i>row</i> of <i>table</i>	
<i>table</i>	a GObject instance that implements AtkTableIface						
<i>row</i>	a <gint> representing a row in <i>table</i>						
<i>description</i>	a <gchar> representing the description text to set for the specified <i>row</i> of <i>table</i>						
atk-table-set-column-description (<i>self <atk-table></i>)	[Function]						
(<i>column int</i>) (<i>description mchars</i>)							
set-column-description	[Method]						
Sets the description text for the specified <i>column</i> of the <i>table</i> .							
<table><tr><td><i>table</i></td><td>a GObject instance that implements AtkTableIface</td></tr><tr><td><i>column</i></td><td>a <gint> representing a column in <i>table</i></td></tr><tr><td><i>description</i></td><td>a <gchar> representing the description text to set for the specified <i>column</i> of the <i>table</i></td></tr></table>	<i>table</i>	a GObject instance that implements AtkTableIface	<i>column</i>	a <gint> representing a column in <i>table</i>	<i>description</i>	a <gchar> representing the description text to set for the specified <i>column</i> of the <i>table</i>	
<i>table</i>	a GObject instance that implements AtkTableIface						
<i>column</i>	a <gint> representing a column in <i>table</i>						
<i>description</i>	a <gchar> representing the description text to set for the specified <i>column</i> of the <i>table</i>						
atk-table-set-row-header (<i>self <atk-table></i>) (<i>row int</i>)	[Function]						
(<i>header <atk-object></i>)							
set-row-header	[Method]						
Sets the specified row header to <i>header</i> .							
<table><tr><td><i>table</i></td><td>a GObject instance that implements AtkTableIface</td></tr><tr><td><i>row</i></td><td>a <gint> representing a row in <i>table</i></td></tr><tr><td><i>header</i></td><td>an <atk-table></td></tr></table>	<i>table</i>	a GObject instance that implements AtkTableIface	<i>row</i>	a <gint> representing a row in <i>table</i>	<i>header</i>	an <atk-table>	
<i>table</i>	a GObject instance that implements AtkTableIface						
<i>row</i>	a <gint> representing a row in <i>table</i>						
<i>header</i>	an <atk-table>						
atk-table-set-column-header (<i>self <atk-table></i>) (<i>column int</i>)	[Function]						
(<i>header <atk-object></i>)							
set-column-header	[Method]						
Sets the specified column header to <i>header</i> .							
<table><tr><td><i>table</i></td><td>a GObject instance that implements AtkTableIface</td></tr><tr><td><i>column</i></td><td>a <gint> representing a column in <i>table</i></td></tr><tr><td><i>header</i></td><td>an <atk-table></td></tr></table>	<i>table</i>	a GObject instance that implements AtkTableIface	<i>column</i>	a <gint> representing a column in <i>table</i>	<i>header</i>	an <atk-table>	
<i>table</i>	a GObject instance that implements AtkTableIface						
<i>column</i>	a <gint> representing a column in <i>table</i>						
<i>header</i>	an <atk-table>						

atk-table-set-summary (*self <atk-table>*) [Function]
 (accessible <atk-object>)
set-summary [Method]
 Sets the summary description of the table.

table a GObject instance that implements AtkTableIface
accessible an <atk-object> representing the summary description to set for *table*

atk-table-is-column-selected (*self <atk-table>*) (*column int*) [Function]
 ⇒ (*ret bool*)
is-column-selected [Method]
 Gets a boolean value indicating whether the specified *column* is selected

table a GObject instance that implements AtkTableIface
column a <gint> representing a column in *table*
ret a gbooleean representing if the column is selected, or 0 if value does not implement this interface.

atk-table-is-row-selected (*self <atk-table>*) (*row int*) [Function]
 ⇒ (*ret bool*)
is-row-selected [Method]
 Gets a boolean value indicating whether the specified *row* is selected

table a GObject instance that implements AtkTableIface
row a <gint> representing a row in *table*
ret a gbooleean representing if the row is selected, or 0 if value does not implement this interface.

atk-table-is-selected (*self <atk-table>*) (*row int*) (*column int*) [Function]
 ⇒ (*ret bool*)
is-selected [Method]
 Gets a boolean value indicating whether the accessible object at the specified *row* and *column* is selected

table a GObject instance that implements AtkTableIface
row a <gint> representing a row in *table*
column a <gint> representing a column in *table*
ret a gbooleean representing if the cell is selected, or 0 if value does not implement this interface.

atk-table-add-column-selection (*self <atk-table>*) (*column int*) [Function]
 ⇒ (*ret bool*)
add-column-selection [Method]
 Adds the specified *column* to the selection.

table a GObject instance that implements AtkTableIface
column a <gint> representing a column in *table*

ret a gboolean representing if the column was successfully added to the selection, or 0 if value does not implement this interface.

atk-table-add-row-selection (*self <atk-table>*) (*row int*) [Function]
⇒ (*ret bool*)
add-row-selection [Method]
Adds the specified *row* to the selection.
table a GObject instance that implements AtkTableIface
row a <gint> representing a row in *table*
ret a gboolean representing if row was successfully added to selection, or 0 if value does not implement this interface.

atk-table-remove-column-selection (*self <atk-table>*) (*column int*) ⇒ (*ret bool*) [Function]
remove-column-selection [Method]
Adds the specified *column* to the selection.
table a GObject instance that implements AtkTableIface
column a <gint> representing a column in *table*
ret a gboolean representing if the column was successfully removed from the selection, or 0 if value does not implement this interface.

atk-table-remove-row-selection (*self <atk-table>*) (*row int*) [Function]
⇒ (*ret bool*)
remove-row-selection [Method]
Removes the specified *row* from the selection.
table a GObject instance that implements AtkTableIface
row a <gint> representing a row in *table*
ret a gboolean representing if the row was successfully removed from the selection, or 0 if value does not implement this interface.

23 AtkText

The ATK interface implemented by components with text content.

23.1 Overview

`<atk-text>` should be implemented by `<atk-objects>` on behalf of widgets that have text content which is either attributed or otherwise non-trivial. `<atk-objects>` whose text content is simple, unattributed, and very brief may expose that content via `<atk-object-get-name>` instead; however if the text is editable, multi-line, typically longer than three or four words, attributed, selectable, or if the object already uses the 'name' ATK property for other information, the `<atk-text>` interface should be used to expose the text content. In the case of editable text content, `<atk-editable-text>` (a subtype of the `<atk-text>` interface) should be implemented instead.

`<atk-text>` provides not only traversal facilities and change notification for text content, but also caret tracking and glyph bounding box calculations. Note that the text strings are exposed as UTF-8, and are therefore potentially multi-byte, and caret-to-byte offset mapping makes no assumptions about the character length; also bounding box glyph-to-offset mapping may be complex for languages which use ligatures.

23.2 Usage

`<atk-text>` [Class]

Derives from `<ginterface>`.

This class defines no direct slots.

`text-changed (arg0 <gint>) (arg1 <gint>)` [Signal on `<atk-text>`]

The "text-changed" signal is emitted when the text of the object which implements the AtkText interface changes. This signal will have a detail which is either "insert" or "delete" which identifies whether the text change was an insertion or a deletion.

`text-caret-moved (arg0 <gint>)` [Signal on `<atk-text>`]

The "text-caret-moved" signal is emitted when the caret position of the text of an object which implements AtkText changes.

`text-selection-changed` [Signal on `<atk-text>`]

The "text-selection-changed" signal is emitted when the selected text of an object which implements AtkText changes.

`text-attributes-changed` [Signal on `<atk-text>`]

The "text-attributes-changed" signal is emitted when the text attributes of the text of an object which implements AtkText changes.

`atk-text-get-text (self <atk-text>) (start_offset int) (end_offset int) => (ret mchars)` [Function]

`get-text` [Method]

Gets the specified text.

`text` an `<atk-text>`

start-offset
 start position
end-offset end position
ret the text from *start-offset* up to, but not including *end-offset*.

atk-text-get-character-at-offset (*self <atk-text>*) (*offset int*) [Function]
 \Rightarrow (*ret unsigned-int32*)

get-character-at-offset [Method]
 Gets the specified text.

text an *<atk-text>*
offset position
ret the character at *offset*.

atk-text-get-text-after-offset (*self <atk-text>*) (*offset int*) [Function]
 $(\text{boundary_type } <\text{atk-text-boundary}>) \Rightarrow (\text{ret mchars}) (\text{start_offset int})$
 (end_offset int)

get-text-after-offset [Method]
 Gets the specified text.

If the boundary_type if ATK_TEXT_BOUNDARY_CHAR the character after the offset is returned.

If the boundary_type is ATK_TEXT_BOUNDARY_WORD_START the returned string is from the word start after the offset to the next word start.

The returned string will contain the word after the offset if the offset is inside a word or if the offset is not inside a word.

If the boundary_type is ATK_TEXT_BOUNDARY_WORD_END the returned string is from the word end at or after the offset to the next work end.

The returned string will contain the word after the offset if the offset is inside a word and will contain the word after the word after the offset if the offset is not inside a word.

If the boundary type is ATK_TEXT_BOUNDARY_SENTENCE_START the returned string is from the sentence start after the offset to the next sentence start.

The returned string will contain the sentence after the offset if the offset is inside a sentence or if the offset is not inside a sentence.

If the boundary_type is ATK_TEXT_BOUNDARY_SENTENCE_END the returned string is from the sentence end at or after the offset to the next sentence end.

The returned string will contain the sentence after the offset if the offset is inside a sentence and will contain the sentence after the sentence after the offset if the offset is not inside a sentence.

If the boundary type is ATK_TEXT_BOUNDARY_LINE_START the returned string is from the line start after the offset to the next line start.

If the boundary_type is ATK_TEXT_BOUNDARY_LINE_END the returned string is from the line end at or after the offset to the next line start.

text an *<atk-text>*

offset position
boundary-type
An <atk-text-boundary>

start-offset the start offset of the returned string
end-offset the offset of the first character after the returned substring
ret the text after *offset* bounded by the specified *boundary-type*.

atk-text-get-text-at-offset (*self* <atk-text>) (*offset* int) [Function]
(*boundary-type* <atk-text-boundary>) => (*ret* mchars) (*start-offset* int)
(*end_offset* int)

get-text-at-offset [Method]

Gets the specified text.

If the boundary_type if ATK_TEXT_BOUNDARY_CHAR the character at the offset is returned.

If the boundary_type is ATK_TEXT_BOUNDARY_WORD_START the returned string is from the word start at or before the offset to the word start after the offset.

The returned string will contain the word at the offset if the offset is inside a word and will contain the word before the offset if the offset is not inside a word.

If the boundary_type is ATK_TEXT_BOUNDARY_WORD_END the returned string is from the word end before the offset to the word end at or after the offset.

The returned string will contain the word at the offset if the offset is inside a word and will contain the word after to the offset if the offset is not inside a word.

If the boundary type is ATK_TEXT_BOUNDARY_SENTENCE_START the returned string is from the sentence start at or before the offset to the sentence start after the offset.

The returned string will contain the sentence at the offset if the offset is inside a sentence and will contain the sentence before the offset if the offset is not inside a sentence.

If the boundary_type is ATK_TEXT_BOUNDARY_SENTENCE_END the returned string is from the sentence end before the offset to the sentence end at or after the offset.

The returned string will contain the sentence at the offset if the offset is inside a sentence and will contain the sentence after the offset if the offset is not inside a sentence.

If the boundary type is ATK_TEXT_BOUNDARY_LINE_START the returned string is from the line start at or before the offset to the line start after the offset.

If the boundary_type is ATK_TEXT_BOUNDARY_LINE_END the returned string is from the line end before the offset to the line end at or after the offset.

text an <atk-text>
offset position

boundary-type

An <atk-text-boundary>

start-offset

the start offset of the returned string

end-offset the offset of the first character after the returned substring

ret the text at *offset* bounded by the specified *boundary-type*.

atk-text-get-text-before-offset (*self* <atk-text>) (*offset int*) [Function]

(*boundary_type* <atk-text-boundary>) ⇒ (*ret mchars*) (*start_offset int*)

(*end_offset int*)

get-text-before-offset [Method]

Gets the specified text.

If the boundary_type if ATK_TEXT_BOUNDARY_CHAR the character before the offset is returned.

If the boundary_type is ATK_TEXT_BOUNDARY_WORD_START the returned string is from the word start before the word start before the offset to the word start before the offset.

The returned string will contain the word before the offset if the offset is inside a word and will contain the word before the word before the offset if the offset is not inside a word.

If the boundary_type is ATK_TEXT_BOUNDARY_WORD_END the returned string is from the word end before the word end at or before the offset to the word end at or before the offset.

The returned string will contain the word before the offset if the offset is inside a word or if the offset is not inside a word.

If the boundary type is ATK_TEXT_BOUNDARY_SENTENCE_START the returned string is from the sentence start before the sentence start before the offset to the sentence start before the offset.

The returned string will contain the sentence before the offset if the offset is inside a sentence and will contain the sentence before the sentence before the offset if the offset is not inside a sentence.

If the boundary_type is ATK_TEXT_BOUNDARY_SENTENCE_END the returned string is from the sentence end before the sentence end at or before the offset to the sentence end at or before the offset.

The returned string will contain the sentence before the offset if the offset is inside a sentence or if the offset is not inside a sentence.

If the boundary type is ATK_TEXT_BOUNDARY_LINE_START the returned string is from the line start before the line start ar or before the offset to the line start ar or before the offset.

If the boundary_type is ATK_TEXT_BOUNDARY_LINE_END the returned string is from the line end before the line end before the offset to the line end before the offset.

text an <atk-text>

<i>offset</i>	position	
<i>boundary-type</i>	An <atk-text-boundary>	
<i>start-offset</i>	the start offset of the returned string	
<i>end-offset</i>	the offset of the first character after the returned substring	
<i>ret</i>	the text before <i>offset</i> bounded by the specified <i>boundary-type</i> .	
atk-text-get-caret-offset (<i>self</i> <atk-text>) ⇒ (<i>ret</i> int)		[Function]
get-caret-offset		[Method]
Gets the offset position of the caret (cursor).		
<i>text</i>	an <atk-text>	
<i>ret</i>	the offset position of the caret (cursor).	
atk-text-get-character-extents (<i>self</i> <atk-text>) (<i>offset</i> int)		[Function]
(<i>coords</i> <atk-coord-type>) ⇒ (<i>x</i> int) (<i>y</i> int) (<i>width</i> int) (<i>height</i> int)		
get-character-extents		[Method]
Get the bounding box containing the glyph representing the character at a particular text offset.		
<i>text</i>	an <atk-text>	
<i>offset</i>	The offset of the text character for which bounding information is required.	
<i>x</i>	Pointer for the x coordinate of the bounding box	
<i>y</i>	Pointer for the y coordinate of the bounding box	
<i>width</i>	Pointer for the width of the bounding box	
<i>height</i>	Pointer for the height of the bounding box	
<i>coords</i>	specify whether coordinates are relative to the screen or widget window	
atk-text-get-character-count (<i>self</i> <atk-text>) ⇒ (<i>ret</i> int)		[Function]
get-character-count		[Method]
Gets the character count.		
<i>text</i>	an <atk-text>	
<i>ret</i>	the number of characters.	
atk-text-get-offset-at-point (<i>self</i> <atk-text>) (<i>x</i> int) (<i>y</i> int)		[Function]
(<i>coords</i> <atk-coord-type>) ⇒ (<i>ret</i> int)		
get-offset-at-point		[Method]
Gets the offset of the character located at coordinates <i>x</i> and <i>y</i> . <i>x</i> and <i>y</i> are interpreted as being relative to the screen or this widget's window depending on <i>coords</i> .		
<i>text</i>	an <atk-text>	
<i>x</i>	screen x-position of character	

<i>y</i>	screen y-position of character	
<i>coords</i>	specify whether coordinates are relative to the screen or widget window	
<i>ret</i>	the offset to the character which is located at the specified <i>x</i> and <i>y</i> coordinates.	
atk-text-get-n-selections (<i>self</i> <atk-text>) ⇒ (<i>ret int</i>)		[Function]
get-n-selections		[Method]
Gets the number of selected regions.		
<i>text</i>	an <atk-text>	
<i>ret</i>	The number of selected regions, or -1 if a failure occurred.	
atk-text-get-selection (<i>self</i> <atk-text>) (<i>selection_num int</i>)		[Function]
⇒ (<i>ret mchars</i>) (<i>start_offset int</i>) (<i>end_offset int</i>)		
get-selection		[Method]
Gets the text from the specified selection.		
<i>text</i>	an <atk-text>	
<i>selection-num</i>		
The selection number. The selected regions are assigned numbers that correspond to how far the region is from the start of the text. The selected region closest to the beginning of the text region is assigned the number 0, etc. Note that adding, moving or deleting a selected region can change the numbering.		
<i>start-offset</i>	passes back the start position of the selected region	
<i>end-offset</i>	passes back the end position of (e.g. offset immediately past) the selected region	
<i>ret</i>	the selected text.	
atk-text-add-selection (<i>self</i> <atk-text>) (<i>start_offset int</i>)		[Function]
(<i>end_offset int</i>) ⇒ (<i>ret bool</i>)		
add-selection		[Method]
Adds a selection bounded by the specified offsets.		
<i>text</i>	an <atk-text>	
<i>start-offset</i>	the start position of the selected region	
<i>end-offset</i>	the offset of the first character after the selected region.	
<i>ret</i>	'#t' if success, '#f' otherwise	
atk-text-remove-selection (<i>self</i> <atk-text>) (<i>selection_num int</i>)		[Function]
⇒ (<i>ret bool</i>)		
remove-selection		[Method]
Removes the specified selection.		

<i>text</i>	an <atk-text>	
<i>selection-num</i>		
	The selection number. The selected regions are assigned numbers that correspond to how far the region is from the start of the text. The selected region closest to the beginning of the text region is assigned the number 0, etc. Note that adding, moving or deleting a selected region can change the numbering.	
<i>ret</i>	'#t' if success, '#f' otherwise	
atk-text-set-selection (<i>self</i> <atk-text>) (<i>selection_num int</i>)		[Function]
(<i>start_offset int</i>) (<i>end_offset int</i>) ⇒ (<i>ret bool</i>)		
set-selection		[Method]
	Changes the start and end offset of the specified selection.	
<i>text</i>	an <atk-text>	
<i>selection-num</i>		
	The selection number. The selected regions are assigned numbers that correspond to how far the region is from the start of the text. The selected region closest to the beginning of the text region is assigned the number 0, etc. Note that adding, moving or deleting a selected region can change the numbering.	
<i>start-offset</i>		
	the new start position of the selection	
<i>end-offset</i>	the new end position of (e.g. offset immediately past) the selection	
<i>ret</i>	'#t' if success, '#f' otherwise	
atk-text-set-caret-offset (<i>self</i> <atk-text>) (<i>offset int</i>)		[Function]
⇒ (<i>ret bool</i>)		
set-caret-offset		[Method]
	Sets the caret (cursor) position to the specified <i>offset</i> .	
<i>text</i>	an <atk-text>	
<i>offset</i>	position	
<i>ret</i>	'#t' if success, '#f' otherwise.	
atk-text-attribute-get-name (<i>attr</i> <atk-text-attribute>)		[Function]
⇒ (<i>ret mchars</i>)		
Gets the name corresponding to the <atk-text-attribute>		
<i>attr</i>	The <atk-text-attribute> whose name is required	
<i>ret</i>	a string containing the name; this string should not be freed	
atk-text-attribute-for-name (<i>name mchars</i>)		[Function]
⇒ (<i>ret <atk-text-attribute></i>)		
Get the <atk-text-attribute> type corresponding to a text attribute name.		
<i>name</i>	a string which is the (non-localized) name of an ATK text attribute.	

ret the <atk-text-attribute> enumerated type corresponding to the specified name, or <atk-text-attribute-invalid> if no matching text attribute is found.

atk-text-attribute-get-value (*attr* <atk-text-attribute>) [Function]
(*index_ int*) ⇒ (*ret mchars*)
Gets the value for the index of the <atk-text-attribute>

attr The <atk-text-attribute> for which a value is required

index The index of the required value

ret a string containing the value; this string should not be freed; NULL is returned if there are no values maintained for the attr value.

24 AtkUtil

A set of ATK utility functions for event and toolkit support.

24.1 Overview

A set of ATK utility functions which are used to support event registration of various types, and obtaining the 'root' accessible of a process and information about the current ATK implementation and toolkit version.

24.2 Usage

<code><atk-util></code>	[Class]
Derives from <code><gobject></code> .	
This class defines no direct slots.	
<code>atk-remove-focus-tracker (tracker_id unsigned-int)</code>	[Function]
Removes the specified focus tracker from the list of functions to be called when any object receives focus.	
<i>tracker-id</i> the id of the focus tracker to remove	
<code>atk-focus-tracker-notify (object <atk-object>)</code>	[Function]
Cause the focus tracker functions which have been specified to be executed for the object.	
<i>object</i> an <code><atk-object></code>	
<code>atk-remove-global-event-listener (listener_id unsigned-int)</code>	[Function]
Removes the specified event listener	
<i>listener-id</i> the id of the event listener to remove	
<code>atk-remove-key-event-listener (listener_id unsigned-int)</code>	[Function]
Removes the specified event listener	
<i>listener-id</i> the id of the event listener to remove	
<code>atk-get-root ⇒ (ret <atk-object>)</code>	[Function]
Gets the root accessible container for the current application.	
<i>ret</i> the root accessible container for the current application	
<code>atk-get-focus-object ⇒ (ret <atk-object>)</code>	[Function]
Gets the currently focused object.	
>Returns:	
<i>ret</i> the currently focused object for the current application	
Since ATK 1.6	
<code>atk-get-toolkit-name ⇒ (ret mchars)</code>	[Function]
Gets name string for the GUI toolkit implementing ATK for this application.	
<i>ret</i> name string for the GUI toolkit implementing ATK for this application	

atk-get-toolkit-version ⇒ (*ret mchars*) [Function]

Gets version string for the GUI toolkit implementing ATK for this application.

ret version string for the GUI toolkit implementing ATK for this application

25 AtkValue

The ATK interface implemented by valuators and components which display or select a value from a bounded range of values.

25.1 Overview

`<atk-value>` should be implemented for components which either display a value from a bounded range, or which allow the user to specify a value from a bounded range, or both. For instance, most sliders and range controls, as well as dials, should have `<atk-object>` representations which implement `<atk-value>` on the component's behalf. `<at-kvalues>` may be read-only, in which case attempts to alter the value return FALSE to indicate failure.

25.2 Usage

<code><atk-value></code>	[Class]
Derives from <code><ginterface></code> .	
This class defines no direct slots.	
<code>atk-value-get-current-value (self <atk-value>) (value <gvalue>)</code>	[Function]
<code>get-current-value</code>	[Method]
Gets the value of this object.	
<code>obj</code> a GObject instance that implements AtkValueIface	
<code>value</code> a <code><gvalue></code> representing the current accessible value	
<code>atk-value-get-maximum-value (self <atk-value>) (value <gvalue>)</code>	[Function]
<code>get-maximum-value</code>	[Method]
Gets the maximum value of this object.	
<code>obj</code> a GObject instance that implements AtkValueIface	
<code>value</code> a <code><gvalue></code> representing the maximum accessible value	
<code>atk-value-get-minimum-value (self <atk-value>) (value <gvalue>)</code>	[Function]
<code>get-minimum-value</code>	[Method]
Gets the minimum value of this object.	
<code>obj</code> a GObject instance that implements AtkValueIface	
<code>value</code> a <code><gvalue></code> representing the minimum accessible value	
<code>atk-value-set-current-value (self <atk-value>) (value <gvalue>)</code>	[Function]
<code>⇒ (ret bool)</code>	
<code>set-current-value</code>	[Method]
Sets the value of this object.	
<code>obj</code> a GObject instance that implements AtkValueIface	
<code>value</code> a <code><gvalue></code> which is the desired new accessible value.	
<code>ret</code> ‘#t’ if new value is successfully set, ‘#f’ otherwise.	

atk-value-get-minimum-increment (*self <atk-value>*) [Function]
 (*value <gvalue>*)
get-minimum-increment [Method]

Gets the minimum increment by which the value of this object may be changed. If zero, the minimum increment is undefined, which may mean that it is limited only by the floating point precision of the platform.

obj a GObject instance that implements AtkValueIface
value a <gvalue> representing the minimum increment by which the accessible value may be changed

Since ATK 1.12

26 Undocumented

The following symbols, if any, have not been properly documented.
