Asymptotic of subsequences of A212382

(*Václav Kotěšovec, published July 17 2014*)

In the OEIS (On-Line Encyclopedia of Integer Sequences) published Alois P. Heinz in 2012 sequences "Number of Dyck n-paths all of whose ascents have lengths equal to 1 (mod p)", which can be generalized (for $p \geq 1$) as the family of the sequences with an ordinary generating function A(x), satisfies functional equation

$$A(x) = 1 + x * \frac{A(x)}{1 - \left(x * A(x)\right)^p}$$

Sequences in the OEIS:
A000108 (p=1), A101785 (p=2), A212383 (p=3), A212384 (p=4), A212385 (p=5), A212386 (p=6), A212387 (p=7), A212388 (p=8), A212389 (p=9), A212390 (p=10), all sequences in one array together A212382.

Theorem (V. Kotěšovec, July 16 2014):
The asymptotic is (for $p \geq 1$)

$$a_n \sim \frac{s^2}{n^{3/2}\, r^{n-1/2} \sqrt{2\pi p\, (s-1)\left(1 + \frac{s}{1 + p\,(s-1)}\right)}}$$

where r $(0 < r < 1)$ and s are real roots of the system of equations

$$r = \frac{p\,(s-1)^2}{s\,(1 - p + ps)} \qquad (rs)^p = \frac{s - 1 - rs}{s - 1}$$

Proof:

Following theorem by Edward A. Bender is (in case of implicit functions) very useful (for proof see [1], p.505 and also [4], p.469).

THEOREM 5. *Assume that the power series $w(z) = \sum a_n z^n$ with nonnegative coefficients satisfies $F(z, w) \equiv 0$. Suppose there exist real numbers $r > 0$ and $s > a_0$ such that*

(i) *for some $\delta > 0$, $F(z, w)$ is analytic whenever $|z| < r + \delta$ and $|q| < s + \delta$;*
(ii) $F(r, s) = F_w(r, s) = 0$;
(iii) $F_z(r, s) \neq 0$, *and* $F_{ww}(r, s) \neq 0$: *and*
(iv) *if* $|z| \leqq r, |w| \leqq s$, *and* $F(z, w) = F_w(z, w) = 0$, *then* $z = r$ *and* $w = s$.

Then

(7.1) $$a_n \sim ((rF_z)/(2\pi F_{ww}))^{1/2} n^{-3/2} r^{-n},$$

where the partial derivatives F_z and F_{ww} are evaluated at $z = r$, $w = s$.

Bender's formula applied for ordinary generating function is

$$a_n \sim \frac{1}{n\, r^n} \sqrt{\frac{r\, F_z}{2\pi n\, F_{ww}}}$$

(for exponential generating function see [8])

Now we have the implicit function

$$f(x, y) = \frac{xy}{1 - (xy)^p} - y + 1$$

partial derivatives		
F_z	$\frac{\partial}{\partial x} f(x,y)$	$\frac{y(p(xy)^p-(xy)^p+1)}{((xy)^p-1)^2}$
F_w	$\frac{\partial}{\partial y} f(x,y)$	$\frac{x(p(xy)^p-(xy)^p+1)}{((xy)^p-1)^2}-1$
F_{ww}	$\frac{\partial}{\partial y}\frac{\partial}{\partial y} f(x,y)$	$-\frac{px(xy)^p(p(xy)^p-(xy)^p+p+1)}{y((xy)^p-1)^3}$

r, s, are roots of the system of equations

$$s\left(\frac{r}{1-(rs)^p}-1\right)+1=0 \qquad \frac{r\,(p\,(rs)^p-(rs)^p+1)}{((rs)^p-1)^2}=1$$

which can be simplified as

$$r = \frac{p\,(s-1)^2}{s\,(1-p+ps)} \qquad (rs)^p = \frac{s-1-rs}{s-1}$$

The asymptotic is then

$$a_n \sim \frac{r^{\frac{1}{2}-n}\sqrt{-\frac{s^3(rs)^{-p-1}((rs)^p-1)(p(rs)^p-(rs)^p+1)}{p(p(rs)^p-(rs)^p+p+1)}}}{\sqrt{2\pi}n^{3/2}}$$

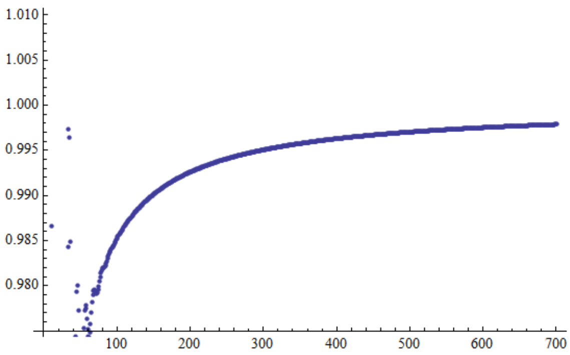
after simplification

$$a_n \sim \frac{s^2}{n^{3/2}\,r^{n-1/2}\sqrt{2\pi p\,(s-1)\left(1+\frac{s}{1+p\,(s-1)}\right)}}$$

Numerical verification (for p=6, A212386)

```
N[Solve[{r == p*(s-1)^2/(s*(1-p+p*s)), (r*s)^p == (s-1-r*s)/(s-1), r > 0, r < 1} /.
   p → 6, {r, s}, Reals], 20]
{{r → 0.39251327125804462442, s → 1.8766537866430581017}}
```

```
ListPlot[
 Table[
  A212386[[n]] /
    (s^2 / (n^(3/2) * r^(n-1/2) * Sqrt[2*Pi*p*(s-1)*(1+s/(1+p*(s-1)))])) /.
   {p → 6, r → 0.3925132712580446244, s → 1.876653786643058101}, {n, 1, Length[A212386]}]]
```



Numerical verification (for p=9, A212389)

```
N[Solve[{r == p * (s - 1) ^2 / (s * (1 - p + p * s)), (r * s) ^p == (s - 1 - r * s) / (s - 1), r > 0, r < 1} /. p → 9,
  {r, s}, Reals], 20]
{{r → 0.41640395155141206718, s → 1.8826164234357634660}}
```

```
ListPlot[
 Table[
  A212389[[n]] /
   (s^2 / (n^(3/2) * r^(n - 1/2) * Sqrt[2 * Pi * p * (s - 1) * (1 + s / (1 + p * (s - 1)))])) /.
  {p → 9, r → 0.4164039515514120671, s → 1.882616423435763466}, {n, 1, Length[A212389]}]]
```
