Dear Dr. Sloane,

I consider the most reliable references to A_n to be contained in vol. I of the collected works of G. A. Miller, published in 1935 by the University of Illinois press. This volume was prepared by Miller himself and contains corrections to some of his earlier papers. Miller wrote a historical note (the first article in the book) on the determination of permutation groups of small degree for this volume.

On page 130 he gives $A_{12} = 295$.

On pages 214-5 he gives $A_{14} = 63$

On page 5 he gives references for the list of all groups of degrees 9 and 10 and presumably the number of transitive ones can be found there.

If you can't get a hold of this book, I can Xerox the appropriate pages for you.

Sincerely

Charles Sims
