```
    254.gap: -fast -O4 -non_shared +CFB +IFB +PFB
 255.vortex: -fast -non_shared +CFB +IFB
  256.bzip2: -fast -O4 -non_shared +CFB

Most benchmarks are built using one or more types of
profile-driven feedback. The types used are designated
by abbreviations in the notes:

+CFB: Code generation is optimized by the compiler, using
      feedback from a training run. These commands are
      done before the first compile (in phase "fdo_pre0"):

```
        mkdir /tmp/pp
        rm -f /tmp/pp/${baseexe}*
```

      and these flags are added to the first and second compiles:

```
        PASS1_CFLAGS = -prof_gen_noopt -prof_dir /tmp/pp
        PASS2_CFLAGS = -prof_use        -prof_dir /tmp/pp
```

      (Peak builds use /tmp/pp above; base builds use /tmp/pb.)

+IFB: Icache usage is improved by the post-link-time optimizer
      Spike, using feedback from a training run. These commands
      are used (in phase "fdo_postN"):

```
        mv ${baseexe} oldexe
        spike oldexe -feedback oldexe -o ${baseexe}
```

+PFB: Prefetches are improved by the post-link-time optimizer
      Spike, using feedback from a training run. These
      commands are used (in phase "fdo_post_makeN"):

```
        rm -f *Counts*
        mv ${baseexe} oldexe
        pixie -stats dstride oldexe 1>pixie.out 2>pixie.err
        mv oldexe.pixie ${baseexe}
```

      A training run is carried out (in phase "fdo_runN"), and
      then this command (in phase "fdo_postN"):

```
        spike oldexe -fb oldexe -stride_prefetch -o ${baseexe}
```

When Spike is used for both Icache and Prefetch improvements,
only one spike command is actually issued, with the Icache
options followed by the Prefetch options.

        vm_bigpg_thresh=16
