# 1 Introduction

## 1.1 Overview

Platforms that require isolation between secure PCI traffic and non-secure PCI traffic can advertise an alternate function number behind the primary Bus:Device:Function. It is up to the software implementation to determine if the alternate function be used for secure traffic and the primary function be used for non-secure traffic or vice-versa. This concept of a 'shadow' alternate function is called Dual-BDF.

PCIe specification defines a "Vendor-Specific Capability", which is a capability structure in PCI-compatible Configuration Space that can be used by a vendor to define a vendor-specific information. This whitepaper document defines one implementation approach to implement a set of IP-Agnostic Dual-BDF Vendor-Specific Capability registers. By using Vendor-Specific Capability, any PCI and PCIe device will be able to implement this Dual-BDF feature. The content of this Dual-BDF Vendor-Specific Capability will use the Designated Vendor-Specific Extended Capability (DVSEC) Header 1 and Header 2 in consideration of future standardization for all IPs to move to PCIe DVSEC – it is required that Software follows the PCIe Specification when interpreting the DVSEC fields.

This Vendor-Specific Capability helps define an agnostic mechanism of discovering the presence and function number of the alternate function. This Vendor-Specific Capability shall be advertised from the Primary BDF.

**Table 2-1. Dual-BDF Vendor Specific Capability**

Bit Location	Description	Attributes
DW0 Bit 7:0	<b>Capability ID</b> - Indicates the PCI Express Capability structure. This field must return a Capability ID of 09h indicating that this is a Vendor-Specific Capability structure.	RO
DW0 Bit 15:8	<b>Next Capability Pointer</b> - This field contains the offset to the next PCI Capability structure or 00h if no other items exist in the linked list of Capabilities.	RO
DW0 Bit 23:16	<b>Capability Length</b> - This field provides the number of bytes in the Capability structure (including the three bytes consumed by the Capability ID, Next Capability Pointer, and Capability Length field). <i>Dual-BDF Feature Capability Length is 0xC.</i>	RO
DW0 Bit 31:24	<b>Reserved</b>	RO
DW1 Bit 15:0	<b>DVSEC Vendor ID</b> - This field is the Vendor ID associated with the vendor that defined the contents of this capability. <i>Shall be 0x8086 (if the vendor intends to use the Intel VID) or 0x1EC0 (if the vendor intends to use the USBIF VID).</i>	RO
DW1 Bit 19:16	<b>DVSEC Revision</b> - This field is a vendor-defined version number that indicates the version of the DVSEC structure. Software must qualify the DVSEC Vendor ID and DVSEC ID before interpreting this field. <i>0x0: First revision.</i>	RO
DW1 Bit 31:20	<b>DVSEC Length</b> - This field indicates the number of bytes in the entire DVSEC structure, including the PCI Express Extended Capability Header, the DVSEC Header 1, DVSEC Header 2, and DVSEC vendor-specific registers. <i>Dual-BDF Feature DVSEC Length is 0xC.</i>	RO

Bit Location	Description	Attributes
DW2 Bit 15:0	<p><b>DVSEC ID</b> - This field is a vendor-defined ID that indicates the nature and format of the DVSEC structure. Software must qualify the DVSEC Vendor ID before interpreting this field.</p> <p><i>Dual-BDF Feature DVSEC ID</i></p> <p><i>Shall be set to 09h if the DVSEC vendor ID field is set to 0x8086.</i></p> <p><i>Shall be set to 02h if the DVSEC vendor ID field is set to 0x1EC0.</i></p>	RO
DW2 Bit 23:16	<p><b>Alternate Function Number Vector</b> - This field is the Function Number of the Alternate Device, converted to 1-hot encoding.</p> <p>Example:</p> <p>Function Number 0 = 0x01</p> <p>Function Number 1 = 0x02</p> <p>...</p> <p>Function Number 7 = 0x80</p>	RO
DW2 Bit 28:24	<p><b>Primary and Alternate Device Number</b> - This field is the Device Number for both the Primary Device and Alternate Device.</p>	RO
DW2 Bit 31:29	<p><b>Reserved</b></p>	RO
